Computer Architecture
Lecture 3a: Memory Systems: Challenges and Opportunities

Prof. Onur Mutlu
ETH Zürich
Fall 2020
24 September 2020

Four Key Problems + Directions

- Fundamentally Secure/Reliable/Safe Architectures

- Fundamentally Energy-Efficient Architectures
  - Memory-centric (Data-centric) Architectures

- Fundamentally Low-Latency and Predictable Architectures

- Architectures for AI/ML, Genomics, Medicine, Health

A Motivating Detour: Genome Sequence Analysis

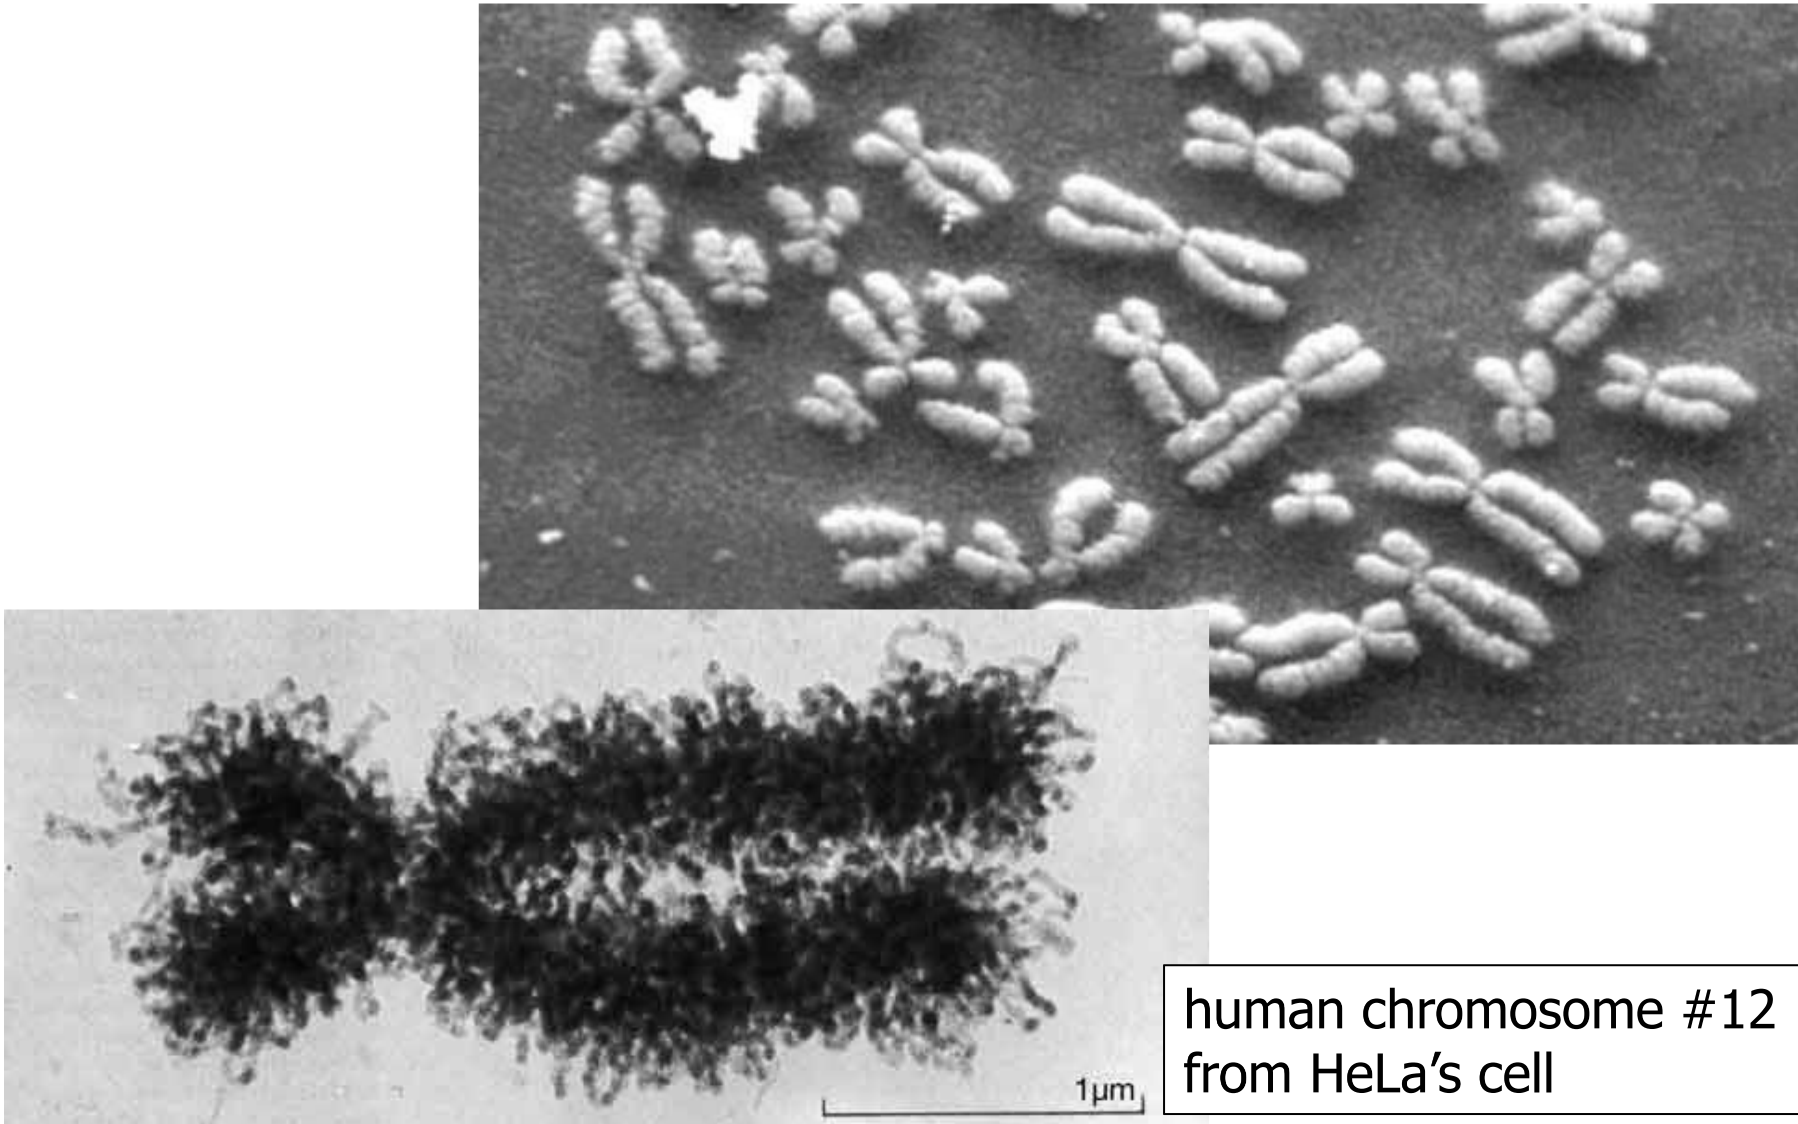
Our Dream (circa 2007)

- An embedded device that can perform comprehensive genome analysis in real time (within a minute)
  - Which of these DNAs does this DNA segment match with?
  - What is the likely genetic disposition of this patient to this drug?
  - . . .

What Is a Genome Made Of?

 The discovery of DNA's double-helical structure (Watson+, 1953)

DNA Under Electron Microscope



human chromosome #12 from HeLa's cell

DNA Sequencing

- Goal:
  - Find the complete sequence of A, C, G, T's in DNA.

- Challenge:
  - There is no machine that takes long DNA as an input, and gives the complete sequence as output
  - All sequencing machines chop DNA into pieces and identify relatively small pieces (but not how they fit together)

Read Mapping 2
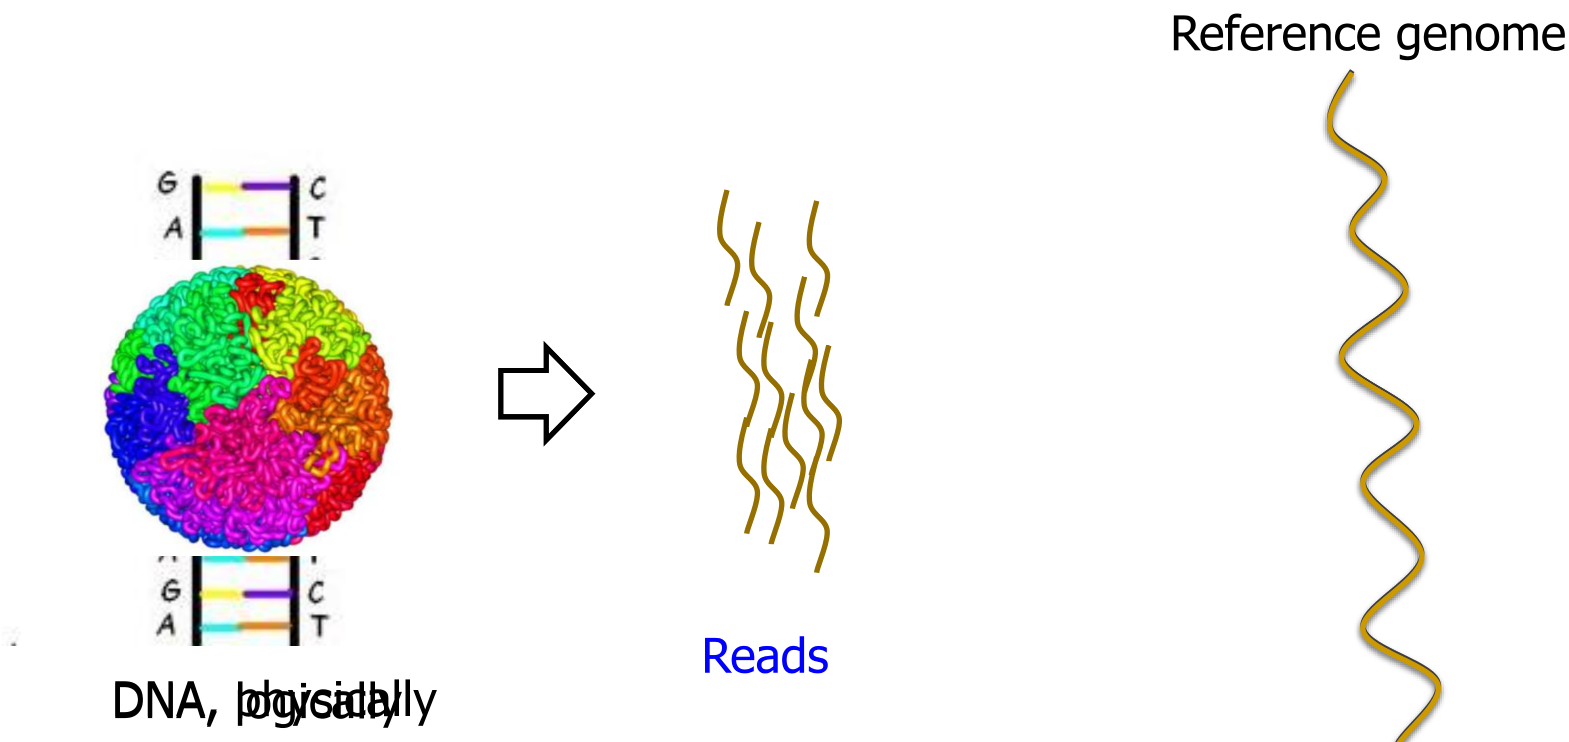
Bottlenecked in Mapping!!
Illumina HiSeq4000
300 M
bases/min
on average
2 M
bases/min
(0.6%)

Problem

Need to construct the entire genome from many reads

Read Mapping

- Map many short DNA fragments (reads) to a known reference genome with some differences allowed



Mapping short reads to reference genome is challenging (billions of 50-300 base pair reads)

Read Alignment/Verification

- **<u>Edit distance</u>** is defined as the minimum number of edits (i.e. insertions, deletions, or substitutions) needed to make the read exactly match the reference segment.

NETHERLANDS x SWITZERLAND

N	E	-	T	H	E	R	L	A	N	D	S
S	W	I	T	Z	E	R	L	A	N	D	-

- match
- deletion
- insertion
- mismatch

Challenges in Read Mapping

- Need to find many mappings of each read
  - How can we find all mappings efficiently?

- Need to tolerate small variances/errors in each read
  - Each individual is different: Subject’s DNA may slightly differ from the reference (Mismatches, insertions, deletions)
  - How can we efficiently map each read with up to *e* errors present?

- Need to map each read very fast (i.e., performance is important)
  - Human DNA is 3.2 billion base pairs long → Millions to billions of reads (State-of-the-art mappers take weeks to map a human’s DNA)
  - How can we design a much higher performance read mapper?

Our First Step: Comprehensive Mapping

- + Guaranteed to find *all* mappings → sensitive
- + Can tolerate up to *e* errors

DNA Read Mapping & Filtering

- Problem: **Heavily bottlenecked by Data Movement**
- GateKeeper FPGA performance limited by DRAM bandwidth [Alser+, Bioinformatics 2017]
- Ditto for SHD on SIMD [Xin+, Bioinformatics 2015]
- Solution: Processing-in-memory can alleviate the bottleneck
- However, we need to design mapping & filtering algorithms to fit processing-in-memory

Quick Note: Key Principles and Results

- Two key principles:
  - Exploit the structure of the genome to minimize computation
  - Morph and exploit the structure of the underlying hardware to maximize performance and efficiency

- **Algorithm-architecture co-design** for DNA read mapping
  - **Speeds up** read mapping by **~300X (sometimes more)**
  - **Improves accuracy** of read mapping in the presence of errors

Recall Our Dream (from 2007)

- An embedded device that can perform comprehensive genome analysis in real time (within a minute)

- Still a long ways to go
  - Energy efficiency
  - Performance (latency)
  - Security
  - **Huge memory bottleneck**

Why Do We Care? An Example from 2020

200 Oxford Nanopore sequencers have left UK for China, to support rapid, near-sample coronavirus sequencing for outbreak surveillance

Fri 31st January 2020

Following extensive support of, and collaboration with, public health professionals in China, Oxford Nanopore has shipped an additional 200 MinION sequencers and related consumables to China. These will be used to support the ongoing surveillance of the current coronavirus outbreak, adding to a large number of the devices already installed in the country.

Each MinION sequencer is approximately the size of a stapler, and can provide rapid sequence information about the coronavirus.

700Kg of Oxford Nanopore sequencers and consumables are on their way for use by Chinese scientists in understanding the current coronavirus outbreak.

Sequencing of COVID-19

- **Whole genome sequencing (WGS) and sequence data analysis are important**
  - To detect the virus from a human sample such as saliva, Bronchoalveolar fluid etc.
  - To understand the sources and modes of transmission of the virus
  - To discover the genomic characteristics of the virus, and compare with the previous viruses (e.g., 02-03 SARS epidemic)
  - To design and evaluate the diagnostic tests

- **Two key areas of COVID-19 genomic research**
  - To sequence the genome of the virus itself, COVID-19, in order to track the mutations in the virus.
  - To explore the genes of infected patients. This analysis can be used to understand why some people get more severe symptoms than others, as well as, help with the development of new treatments in the future.

  - Energy efficiency
  - Performance (latency)
  - Security
  - **Huge memory bottleneck**

Four Key Directions

- Fundamentally Secure/Reliable/Safe Architectures
- Fundamentally Energy-Efficient Architectures
  - Memory-centric (Data-centric) Architectures
- Fundamentally Low-Latency and Predictable Architectures
- Architectures for AI/ML, Genomics, Medicine, Health

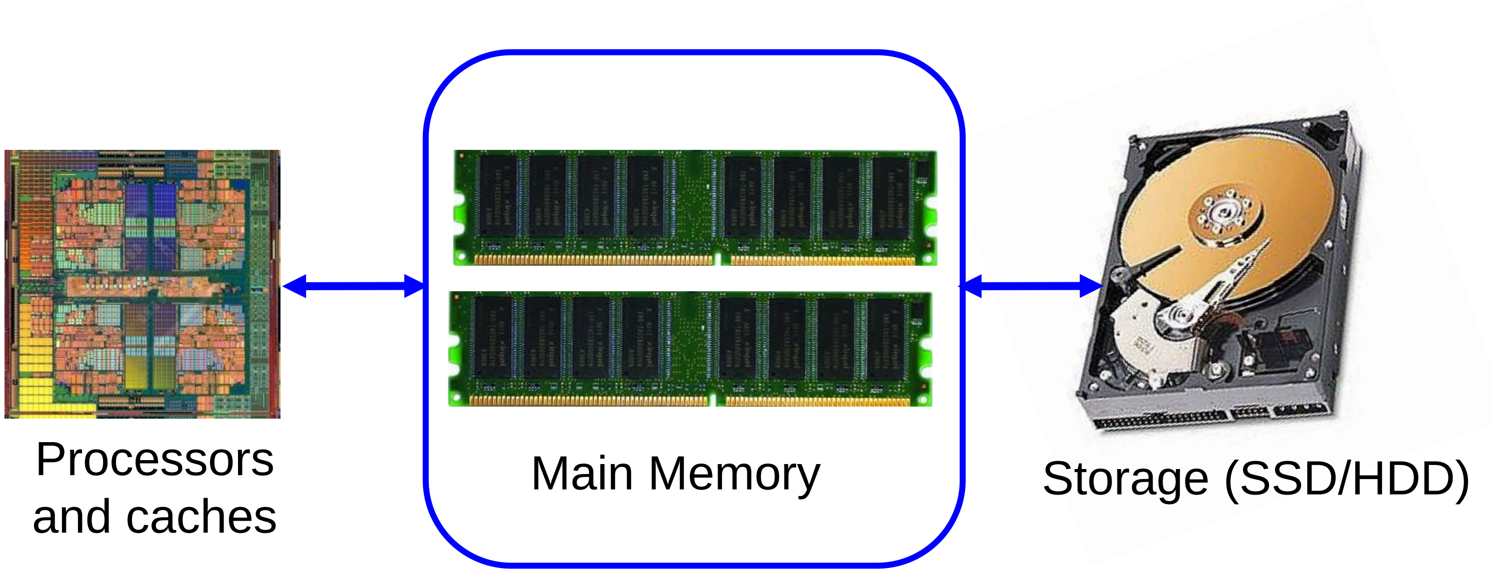
Memory & Storage

Why Is Memory So Important?
(Especially Today)

Importance of Main Memory

- The Performance Perspective
- The Energy Perspective
- The Scaling/Reliability/Security Perspective
- Trends/Challenges/Opportunities in Main Memory

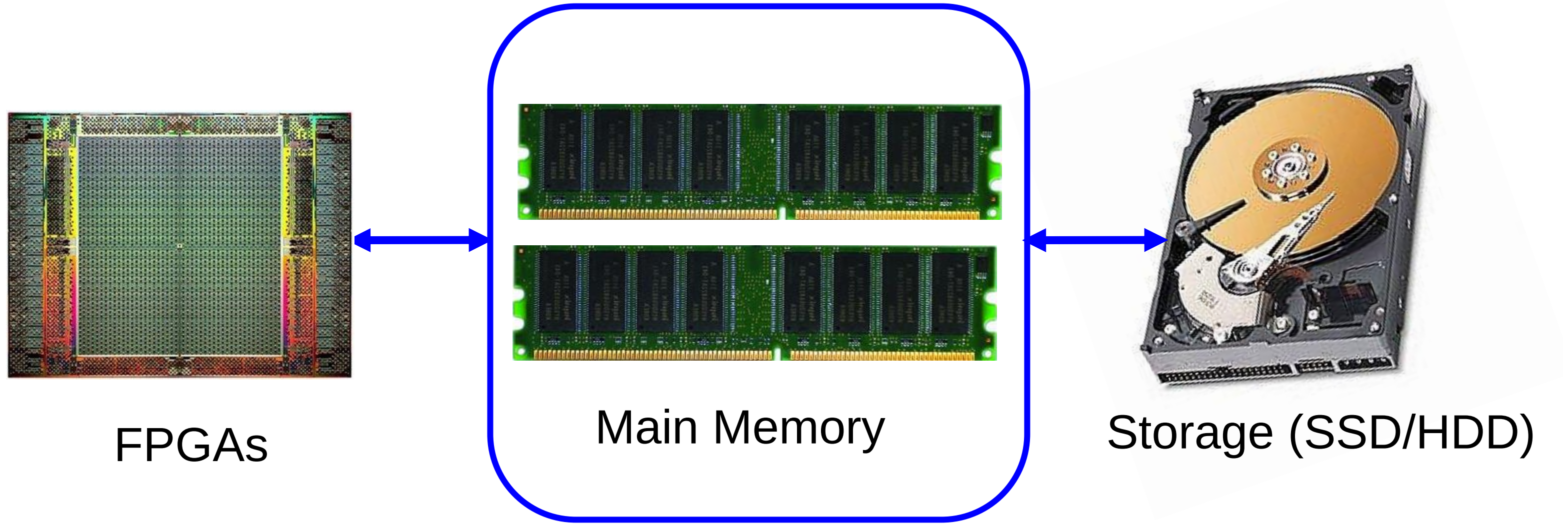
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

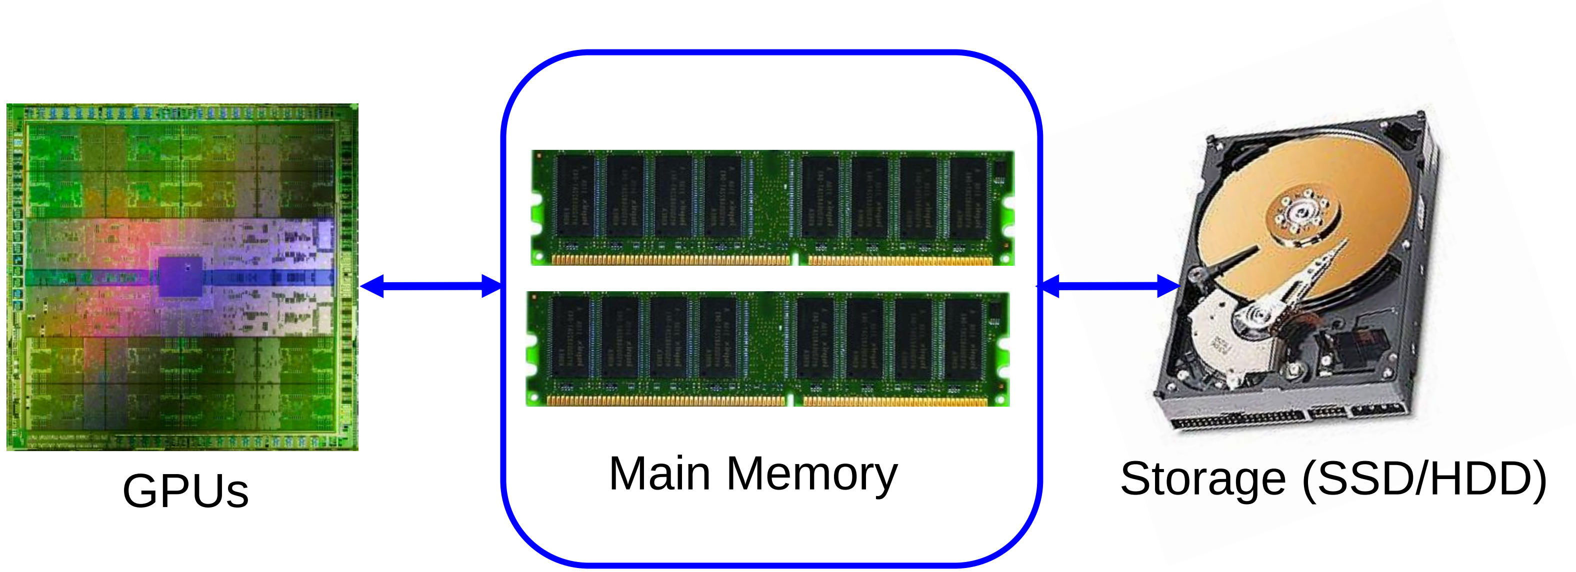
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

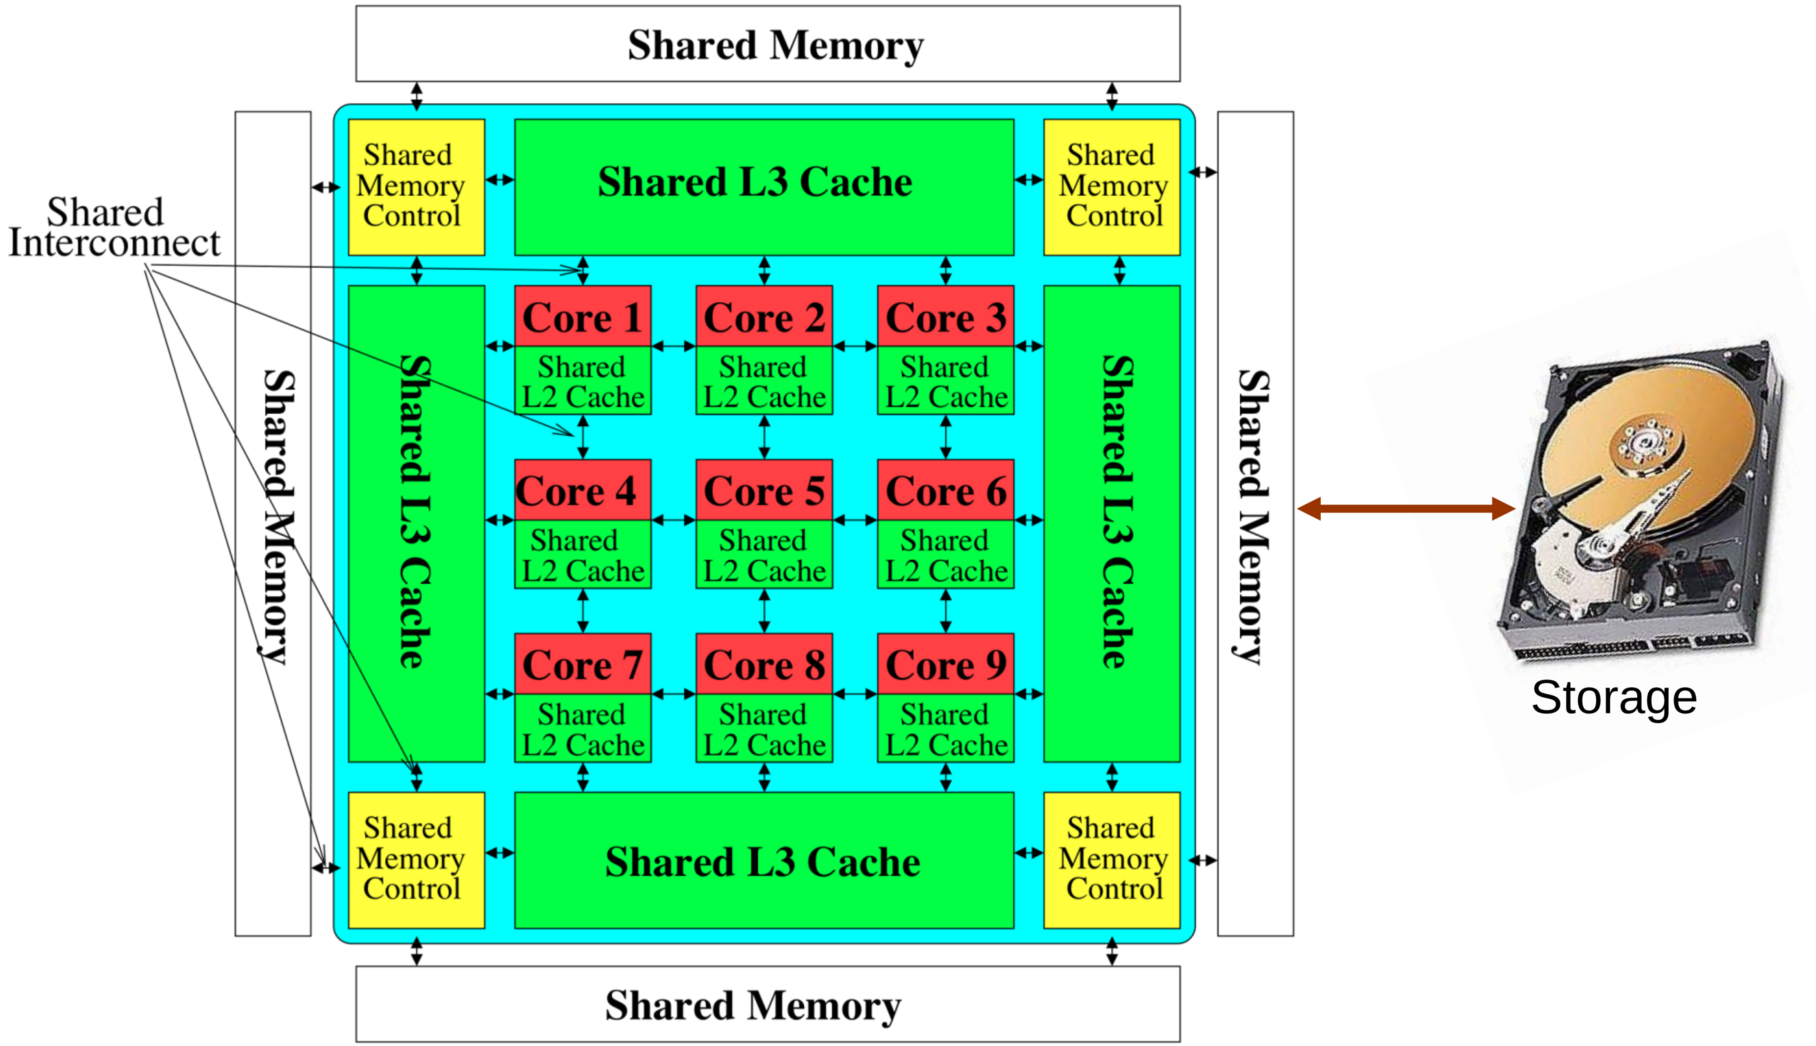
The Main Memory System



- Main memory is a critical component of all computing systems: server, mobile, embedded, desktop, sensor

- Main memory system must scale (in *size*, *technology*, *efficiency*, *cost*, and *management algorithms*) to maintain performance growth and technology scaling benefits

Memory System: A ***Shared Resource*** View



Most of the system is dedicated to storing and moving data

State of the Main Memory System

- Recent technology, architecture, and application trends
  - lead to new requirements
  - exacerbate old requirements

- DRAM and memory controllers, as we know them today, are (will be) unlikely to satisfy all requirements

- Some emerging non-volatile memory technologies (e.g., PCM) enable new opportunities: memory+storage merging

- We need to rethink the main memory system
  - to fix DRAM issues and enable emerging technologies
  - to satisfy all requirements

Major Trends Affecting Main Memory (I)

- Need for main memory capacity, bandwidth, QoS increasing

- Main memory energy/power is a key system design concern

- DRAM technology scaling is ending

Major Trends Affecting Main Memory (II)

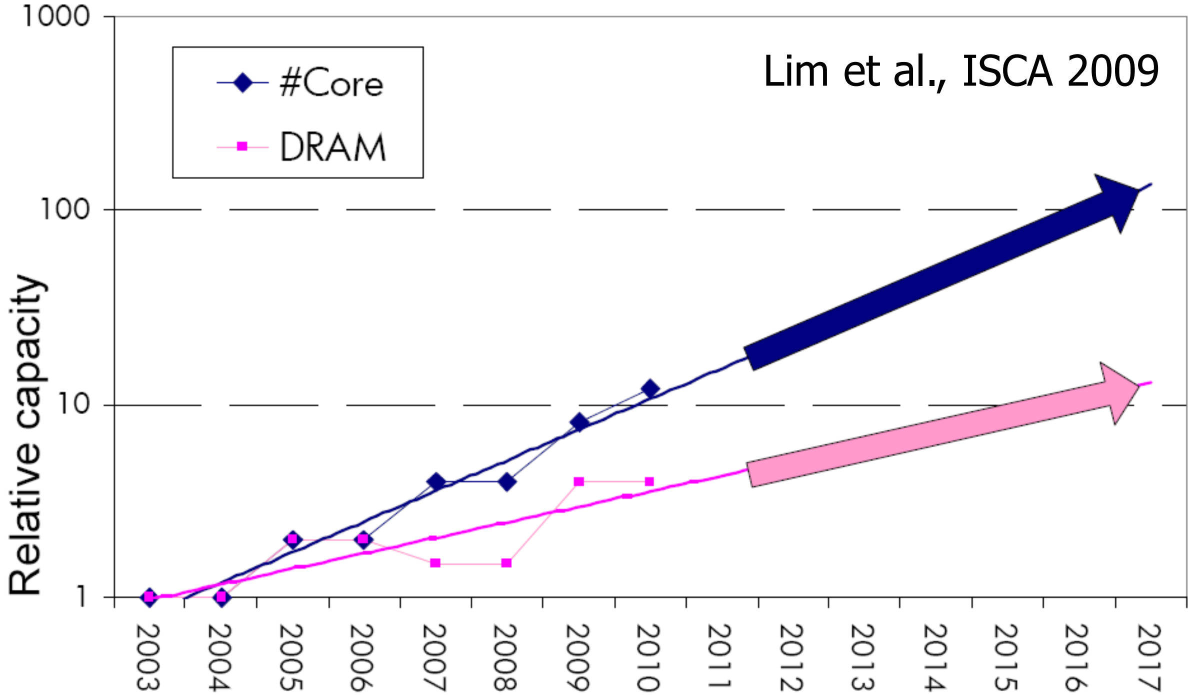
- Need for main memory capacity, bandwidth, QoS increasing
  - Multi-core: increasing number of cores/agents
  - Data-intensive applications: increasing demand/hunger for data
  - Consolidation: cloud computing, GPUs, mobile, heterogeneity

- Main memory energy/power is a key system design concern

- DRAM technology scaling is ending

Consequence: The Memory Capacity Gap

Core count doubling ~ every 2 years
DRAM DIMM capacity doubling ~ every 3 years



- *Memory capacity per core* expected to drop by 30% every two years
- Trends worse for *memory bandwidth per core*!

RUNAHEAD EXECUTION: AN EFFECTIVE ALTERNATIVE TO LARGE INSTRUCTION WINDOWS

It's the Memory, Stupid!

RICHARD SITES

It's the Memory, Stupid!

When we started the Alpha architecture design in 1988, we estimated a 25-year lifetime and a relatively modest 32% per year compounded performance improvement of implementations over that lifetime (1,000× total). We guestimated about 10× would come from CPU clock improvement, 10× from multiple instruction issue, and 10× from multiple processors.

5, 1996 MICROPROCESSOR REPORT

An Informal Interview on Memory

- Madeleine Gray and Onur Mutlu,
  "'It's the memory, stupid': A conversation with Onur Mutlu"
  HiPEAC info 55, *HiPEAC Newsletter*, October 2018.
  [Shorter Version in Newsletter]
  [Longer Online Version with References]

'It's the memory, stupid': A conversation with Onur Mutlu

'We're beyond computation; we know how to do computation really well, we can optimize it, we can build all sorts of accelerators ... but the memory – how to feed the data, how to get the data into the accelerators – is a huge problem.'

This was how ETH Zürich and Carnegie Mellon Professor Onur Mutlu opened his course on memory systems and memory-centric computing systems at HiPEAC's summer school, ACACES18. A prolific publisher – he recently bagged the top spot on the International Symposium on Computer Architecture (ISCA) hall of fame – Onur is passionate about computation and communication that are efficient and secure by design. In advance of our Computing Systems Week focusing on data centres, storage, and networking, which takes place next week in Heraklion, HiPEAC picked his brains on all things data-based.

The Memory Bottleneck

- All of Google's Data Center Workloads (2015):

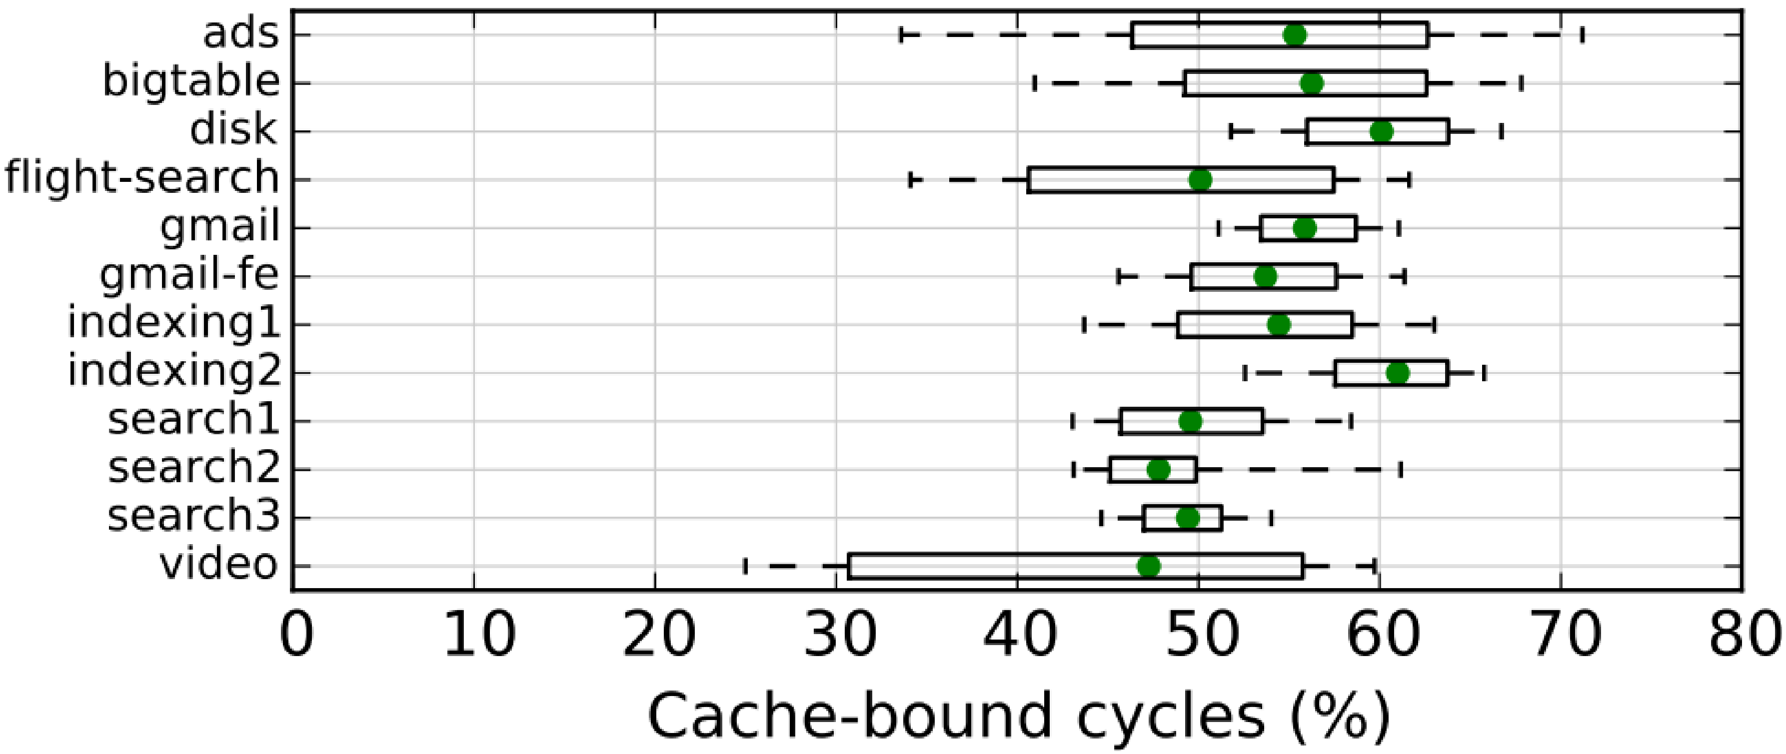

Figure 11: Half of cycles are spent stalled on caches.

Kanev+, "Profiling a Warehouse-Scale Computer," ISCA 2015.

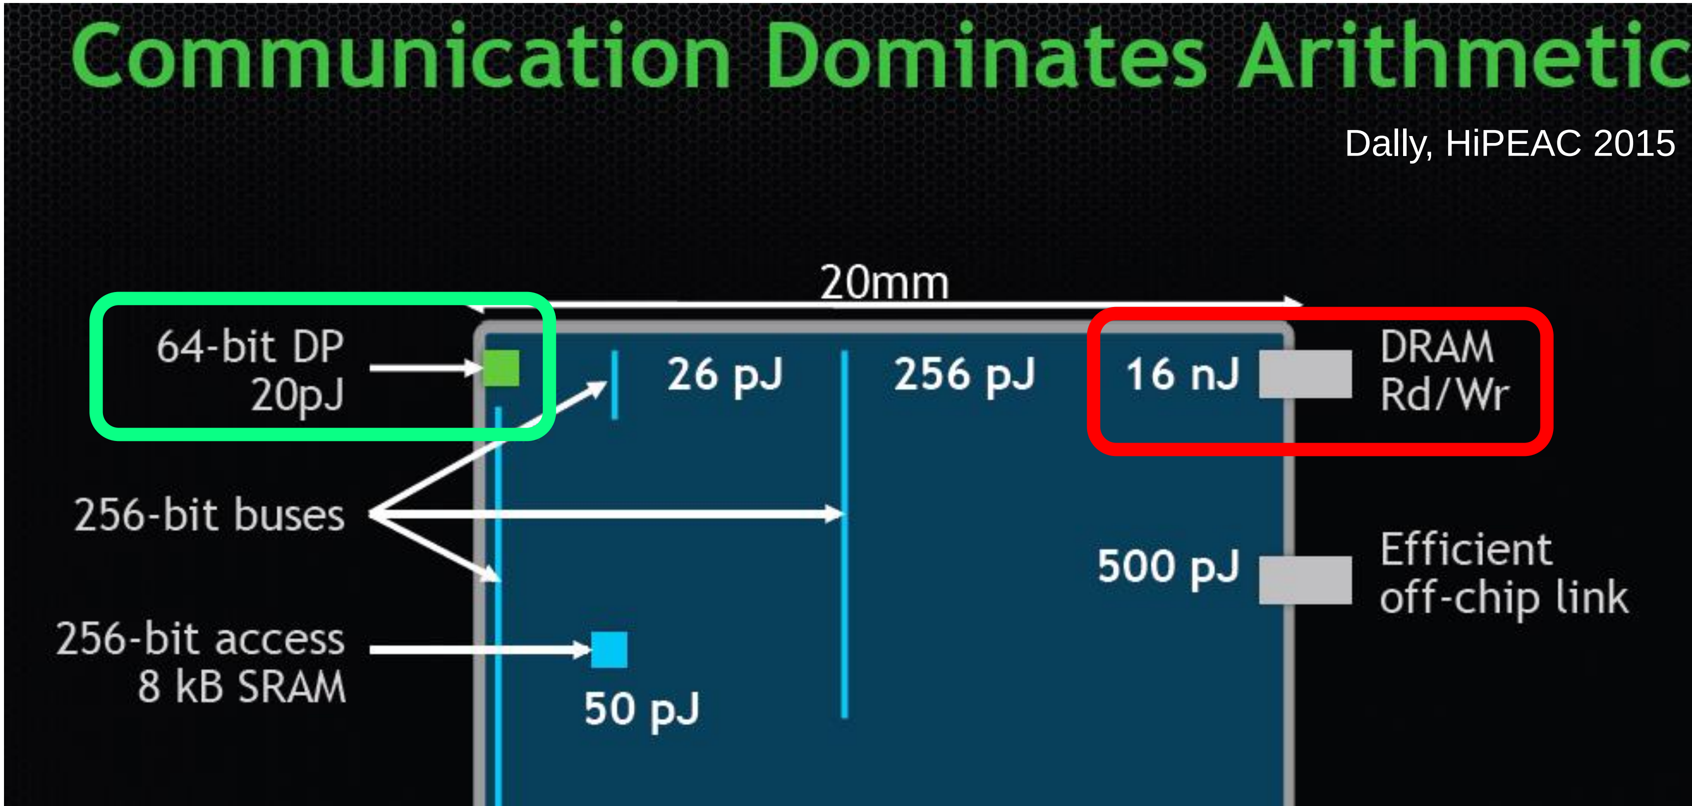
Major Trends Affecting Main Memory (III)

- Need for main memory capacity, bandwidth, QoS increasing

- Main memory energy/power is a key system design concern
  - ~40-50% energy spent in off-chip memory hierarchy [Lefurgy, IEEE Computer'03] >40% power in DRAM [Ware, HPCA'10][Paul,ISCA'15]
  - DRAM consumes power even when not used (periodic refresh)

- DRAM technology scaling is ending

Energy Cost of Data Movement



A memory access consumes ~1000X the energy of a complex addition

Energy Waste in Mobile Devices

- Amirali Boroumand, Saugata Ghose, Youngsok Kim, Rachata Ausavarungnirun, Eric Shiu, Rahul Thakur, Daehyun Kim, Aki Kuusela, Allan Knies, Parthasarathy Ranganathan, and Onur Mutlu, **"Google Workloads for Consumer Devices: Mitigating Data Movement Bottlenecks"** *Proceedings of the 23rd International Conference on Architectural Support for Programming Languages and Operating Systems* (***ASPLOS***), Williamsburg, VA, USA, March 2018.

62.7% of the total system energy is spent on data movement

Major Trends Affecting Main Memory (IV)

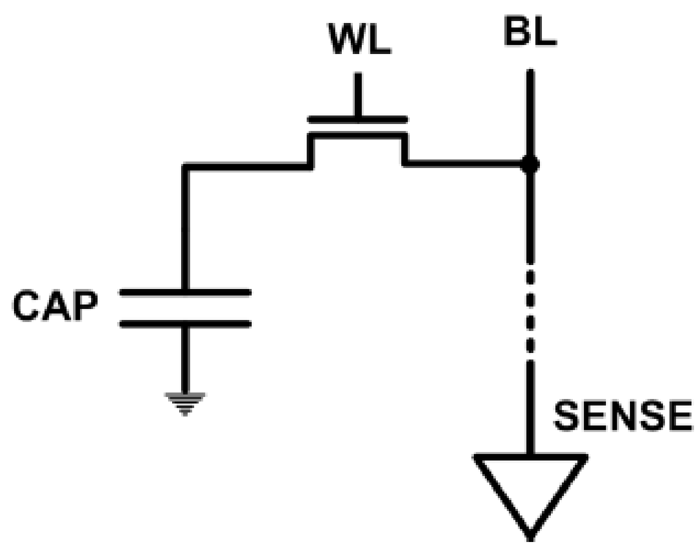
- Need for main memory capacity, bandwidth, QoS increasing

- Main memory energy/power is a key system design concern

- DRAM technology scaling is ending
  - ITRS projects DRAM will not scale easily below X nm
  - Scaling has provided many benefits:
    - higher capacity (density), lower cost, lower energy

The DRAM Scaling Problem

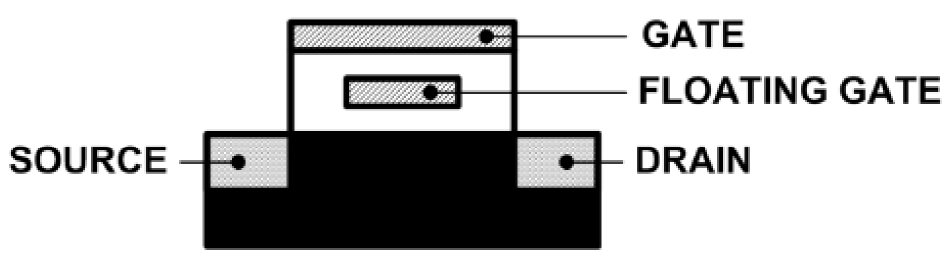
- DRAM stores charge in a capacitor (charge-based memory)
  - Capacitor must be large enough for reliable sensing
  - Access transistor should be large enough for low leakage and high retention time
  - Scaling beyond 40-35nm (2013) is challenging [ITRS, 2009]

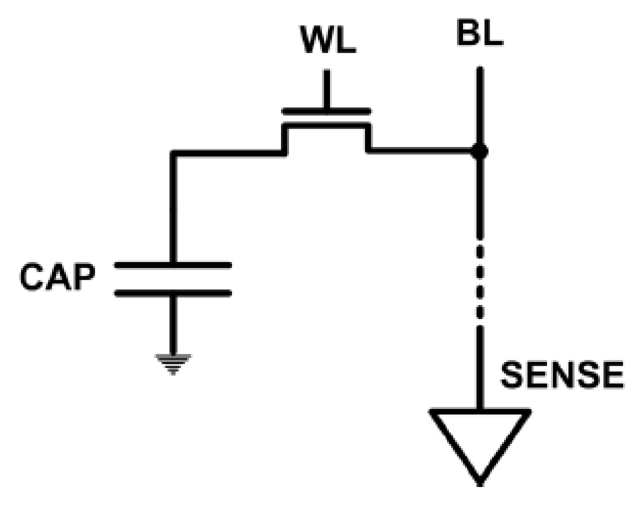


- DRAM capacity, cost, and energy/power hard to scale

Limits of Charge Memory

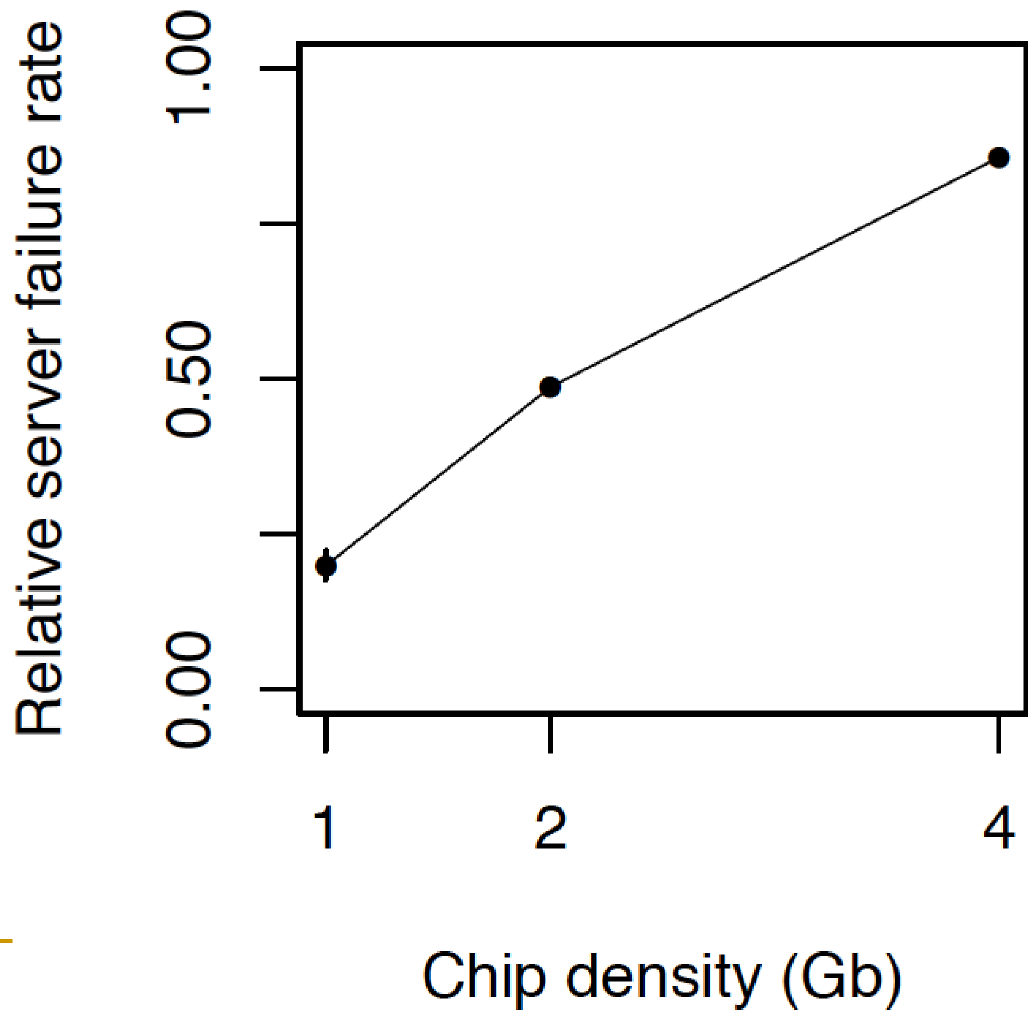
- Difficult charge placement and control
  - Flash: floating gate charge
  - DRAM: capacitor charge, transistor leakage
- Data retention and reliable sensing becomes difficult as charge storage unit size reduces





As Memory Scales, It Becomes Unreliable

- Data from all of Facebook's servers worldwide
- Meza+, "Revisiting Memory Errors in Large-Scale Production Data Centers," DSN'15.



Intuition: quadratic increase in capacity

Large-Scale Failure Analysis of DRAM Chips

Major Trends Affecting Main Memory (V)

- DRAM scaling has already become increasingly difficult
  - Increasing cell leakage current, reduced cell reliability, increasing manufacturing difficulties [Kim+ ISCA 2014], [Liu+ ISCA 2013], [Mutlu IMW 2013], [Mutlu DATE 2017]
  - **Difficult to significantly improve capacity, energy**

- **Emerging memory technologies** are promising

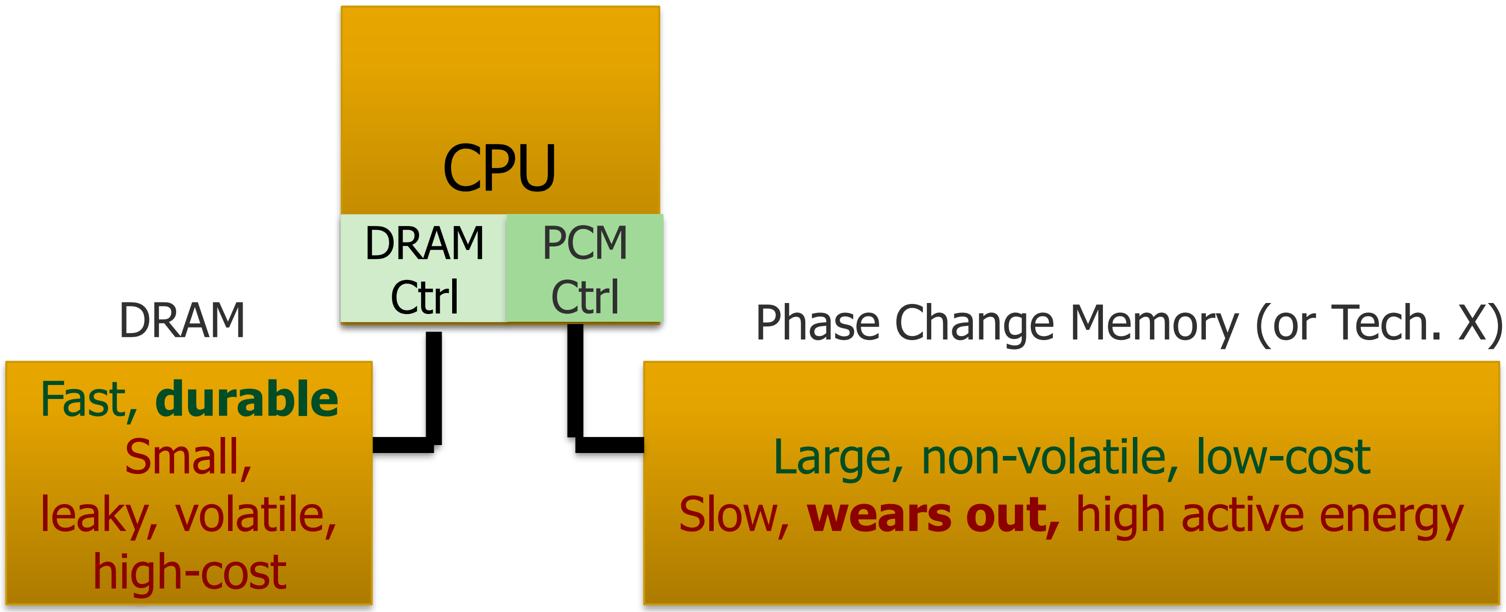
Major Trends Affecting Main Memory (V)

- DRAM scaling has already become increasingly difficult
  - Increasing cell leakage current, reduced cell reliability, increasing manufacturing difficulties [Kim+ ISCA 2014], [Liu+ ISCA 2013], [Mutlu IMW 2013], [Mutlu DATE 2017]
  - **Difficult to significantly improve capacity, energy**

- **Emerging memory technologies** are promising

3D-Stacked DRAM	higher bandwidth	smaller capacity
Reduced-Latency DRAM (e.g., RL/TL-DRAM, FLY-RAM)	lower latency	higher cost
Low-Power DRAM (e.g., LPDDR3, LPDDR4, Voltron)	lower power	higher latency higher cost
Non-Volatile Memory (NVM) (e.g., PCM, STTRAM, ReRAM, 3D Xpoint)	larger capacity	higher latency higher dynamic power lower endurance

Major Trend: Hybrid Main Memory



Hardware/software manage data allocation and movement
to achieve the best of multiple technologies

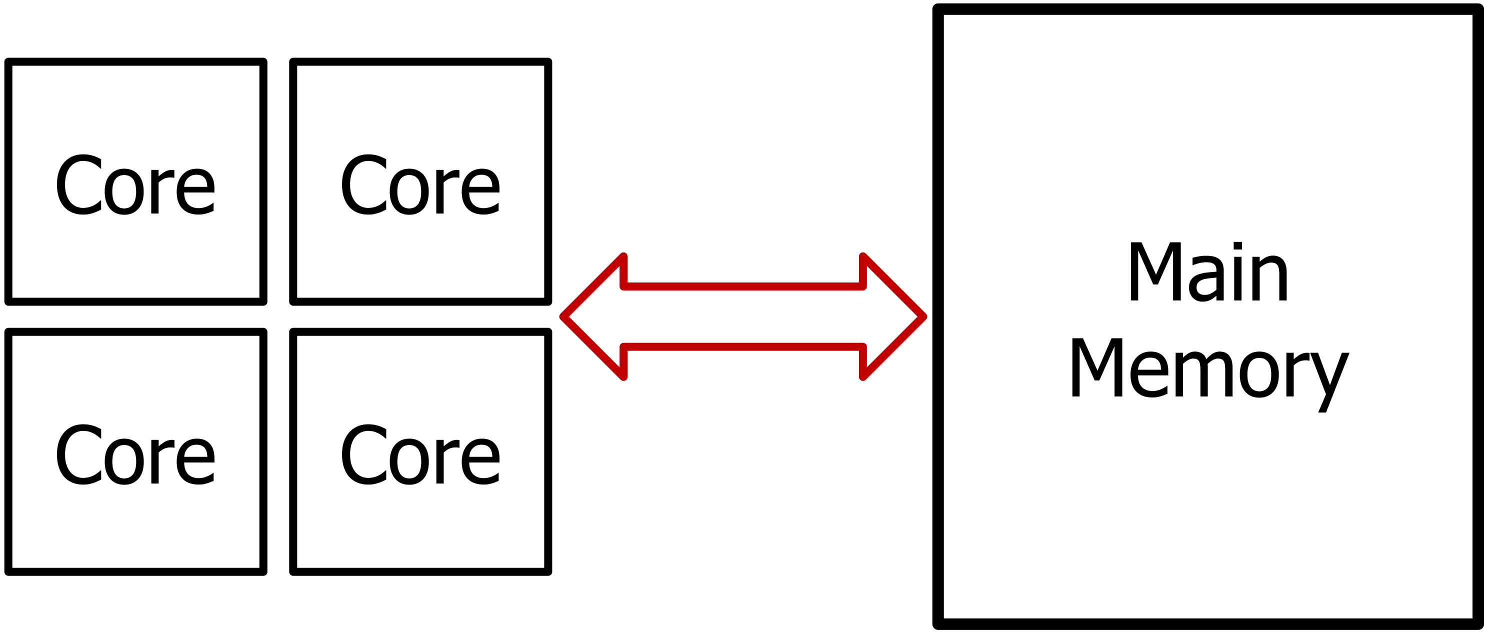
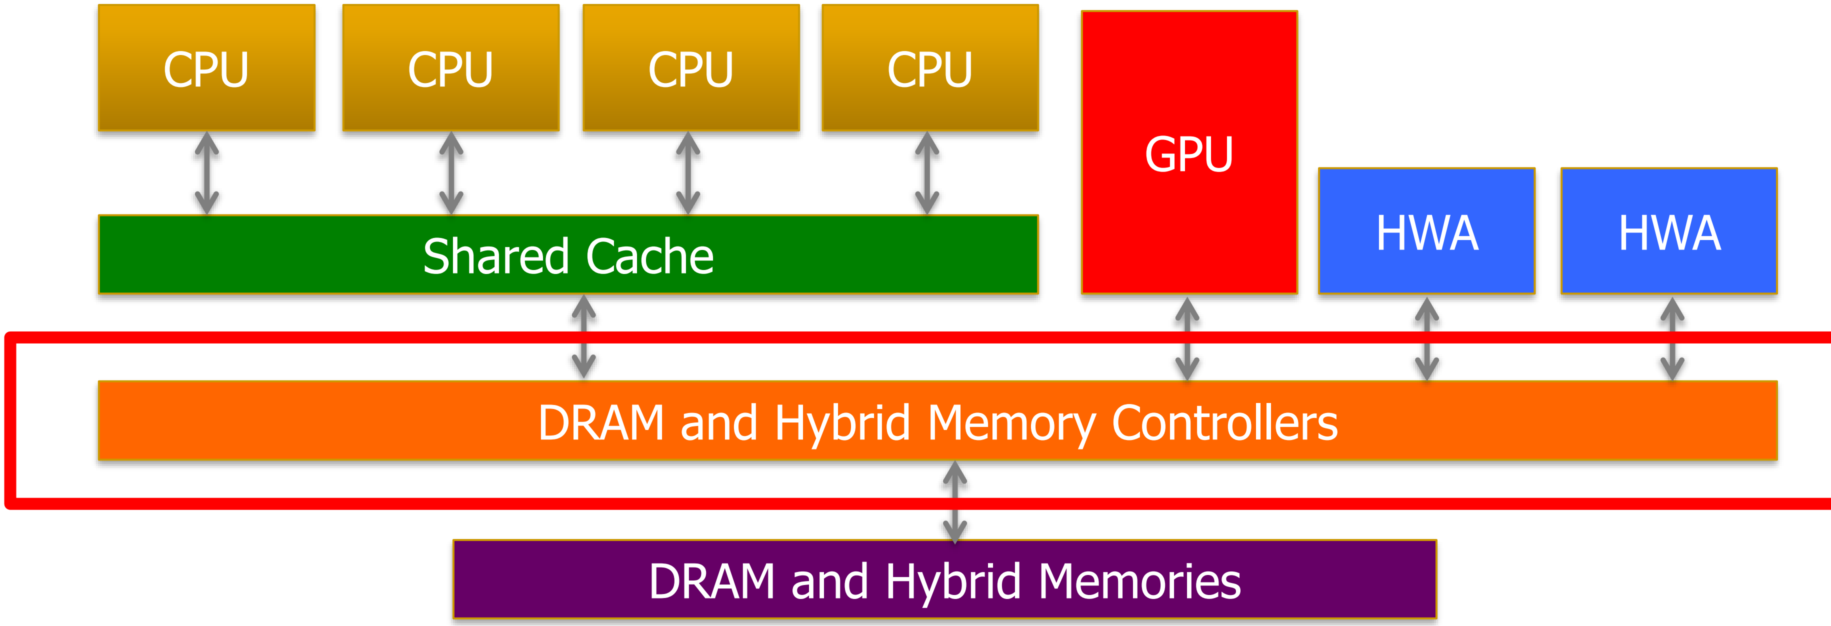
An Orthogonal Issue: Memory Interference



Cores' interfere with each other when accessing shared main memory

Uncontrolled interference leads to many problems (QoS, performance)

Goal: Predictable Performance in Complex Systems



- Heterogeneous agents: CPUs, GPUs, and HWAs
- Main memory interference between CPUs, GPUs, HWAs

How to allocate resources to heterogeneous agents to mitigate interference and provide predictable performance?

Trends, Challenges, and Opportunities in Main Memory

How Do We Solve **The Memory Problem?**

- Fix it: Make memory and controllers more intelligent
  - New interfaces, functions, architectures: system-mem codesign
- Eliminate or minimize it: Replace or (more likely) augment DRAM with a different technology
  - New technologies and system-wide rethinking of memory & storage
- Embrace it: Design heterogeneous memories (none of which are perfect) and map data intelligently across them
  - New models for data management and maybe usage
- ...

Solutions (to memory scaling) require software/hardware/device cooperation

Solution 1: New Memory Architectures

- Overcome memory shortcomings with
  - Memory-centric system design
  - Novel memory architectures, interfaces, functions
  - Better waste management (efficient utilization)

- Key issues to tackle
  - Enable reliability at low cost → high capacity
  - Reduce energy
  - Reduce latency
  - Improve bandwidth
  - Reduce waste (capacity, bandwidth, latency)
  - Enable computation close to data

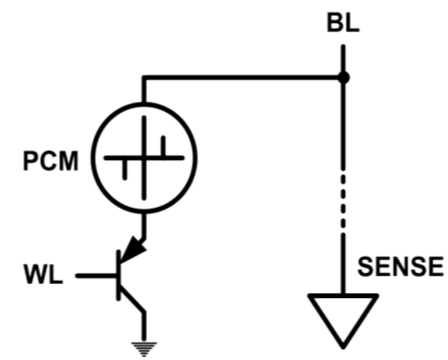
  - Pekhimenko+, "Toggle-Aware Bandwidth Compression for GPUs," HPCA 2016.

Solution 2: Emerging Memory Technologies

- Some emerging **resistive** memory technologies seem more scalable than DRAM (and they are non-volatile)

- Example: Phase Change Memory
  - Data stored by changing phase of material
  - Data read by detecting material's resistance
  - Expected to scale to 9nm (2022 [ITRS 2009])
  - Prototyped at 20nm (Raoux+, IBM JRD 2008)
  - Expected to be denser than DRAM: can store multiple bits/cell



- But, emerging technologies have (many) shortcomings
  - Can they be enabled to replace/augment/surpass DRAM?

An Orthogonal Issue: Memory Interference

- Problem: Memory interference between cores is uncontrolled
  → unfairness, starvation, low performance
  → uncontrollable, unpredictable, vulnerable system

- Solution: QoS-Aware Memory Systems
  - Hardware designed to provide a configurable fairness substrate
    - Application-aware memory scheduling, partitioning, throttling
  - Software designed to configure the resources to satisfy different QoS goals

- QoS-aware memory systems can provide predictable performance and higher efficiency

Strong Memory Service Guarantees

- Goal: Satisfy performance/SLA requirements in the presence of shared main memory, heterogeneous agents, and hybrid memory/storage

- Approach:
  - Develop techniques/models to accurately estimate the performance loss of an application/agent in the presence of resource sharing
  - Develop mechanisms (hardware and software) to enable the resource partitioning/prioritization needed to achieve the required performance levels for all applications
  - All the while providing high system performance

DRAM Controllers

It All Started with FSB Controllers (2001)

Method and apparatus to control memory accesses

Abstract

A method and apparatus for accessing memory comprising monitoring memory accesses from a hardware prefetcher and determining whether the memory accesses from the hardware prefetcher are used by an out-of-order core. A front side bus controller switches memory access modes from a minimize memory access latency mode to a maximize memory bus bandwidth mode if a percentage of the memory accesses generated by the hardware prefetcher are used by the out-of-order core.

Readings, Videos, Reference Materials

Accelerated Memory Course (~6.5 hours)

- ACACES 2018
  - Memory Systems and Memory-Centric Computing Systems
  - Taught by Onur Mutlu July 9-13, 2018
  - ~6.5 hours of lectures

- Website for the Course including Videos, Slides, Papers
  - https://safari.ethz.ch/memory_systems/ACACES2018/
  - https://www.youtube.com/playlist?list=PL5Q2soXY2Zi-HXxomthrpDpMJm05P6J9x

- All Papers are at:
  - https://people.inf.ethz.ch/omutlu/projects.htm
  - Final lecture notes and readings (for all topics)

Longer Memory Course (~18 hours)

- Tu Wien 2019
  - Memory Systems and Memory-Centric Computing Systems
  - Taught by Onur Mutlu June 12-19, 2019
  - ~18 hours of lectures

- Website for the Course including Videos, Slides, Papers
  - https://safari.ethz.ch/memory_systems/TUWien2019
  - https://www.youtube.com/playlist?list=PL5Q2soXY2Zi_gntM55VoMlKlw7YrXOhbl

- All Papers are at:
  - https://people.inf.ethz.ch/omutlu/projects.htm
  - Final lecture notes and readings (for all topics)

INVITED PAPER

Proceedings of the IEEE, Sept. 2017

Error Characterization, Mitigation, and Recovery in Flash-Memory-Based Solid-State Drives

This paper reviews the most recent advances in solid-state drive (SSD) error characterization, mitigation, and data recovery techniques to improve both SSD's reliability and lifetime.

Ramulator: A Fast and Extensible DRAM Simulator

[IEEE Comp Arch Letters'15]

Ramulator Motivation

- DRAM and Memory Controller landscape is changing
- Many new and upcoming standards
- Many new controller designs
- A fast and easy-to-extend simulator is very much needed

Segment	*DRAM Standards & Architectures*
Commodity	DDR3 (2007) [14]; DDR4 (2012) [18]
Low-Power	LPDDR3 (2012) [17]; LPDDR4 (2014) [20]
Graphics	GDDR5 (2009) [15]
Performance	eDRAM [28], [32]; RLDRAM3 (2011) [29]
3D-Stacked	WIO (2011) [16]; WIO2 (2014) [21]; MCDRAM (2015) [13]; HBM (2013) [19]; HMC1.0 (2013) [10]; HMC1.1 (2014) [11]
Academic	SBA/SSA (2010) [38]; Staged Reads (2012) [8]; RAIDR (2012) [27]; SALP (2012) [24]; TL-DRAM (2013) [26]; RowClone (2013) [37]; Half-DRAM (2014) [39]; Row-Buffer Decoupling (2014) [33]; SARP (2014) [6]; AL-DRAM (2015) [25]

Table 1. Landscape of DRAM-based memory

Ramulator

- Provides out-of-the box support for many DRAM standards:
  - DDR3/4, LPDDR3/4, GDDR5, WIO1/2, HBM, plus new proposals (SALP, AL-DRAM, TLDRAM, RowClone, and SARP)
- ~2.5X faster than fastest open-source simulator
- Modular and extensible to different standards

Simulator (clang -O3)	*Cycles* (10^6)		*Runtime (sec.)*		*Req/sec* (10^3)		*Memory (MB)*
	Random	*Stream*	*Random*	*Stream*	*Random*	*Stream*	
Ramulator	652	411	752	249	133	402	2.1
DRAMSim2	645	413	2,030	876	49	114	1.2
USIMM	661	409	1,880	750	53	133	4.5
DrSim	647	406	18,109	12,984	6	8	1.6
NVMain	666	413	6,881	5,023	15	20	4,230.0

Table 3. Comparison of five simulators using two traces

Case Study: Comparison of DRAM Standards

Standard	*Rate (MT/s)*	*Timing (CL-RCD-RP)*	*Data-Bus (Width×Chan.)*	*Rank-per-Chan*	*BW (GB/s)*
DDR3	1,600	11-11-11	64-bit × 1	1	11.9
DDR4	2,400	16-16-16	64-bit × 1	1	17.9
SALP†	1,600	11-11-11	64-bit × 1	1	11.9
LPDDR3	1,600	12-15-15	64-bit × 1	1	11.9
LPDDR4	2,400	22-22-22	32-bit × 2*	1	17.9
GDDR5 [12]	6,000	18-18-18	64-bit × 1	1	44.7
HBM	1,000	7-7-7	128-bit × 8*	1	119.2
WIO	266	7-7-7	128-bit × 4*	1	15.9
WIO2	1,066	9-10-10	128-bit × 8*	1	127.2

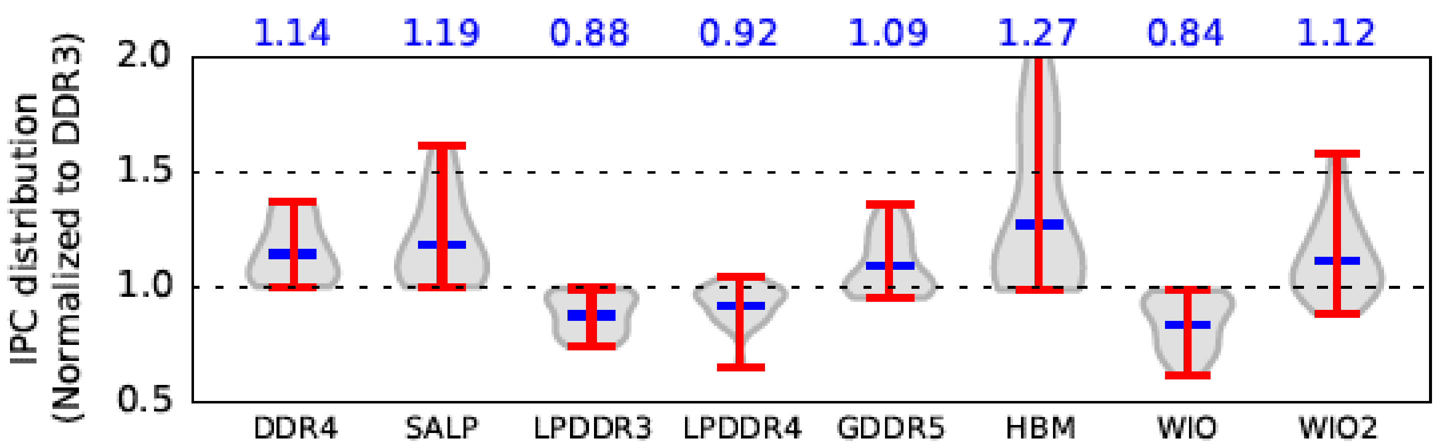

Figure 2. Performance comparison of DRAM standards

Across 22 workloads, simple CPU model

Ramulator Paper and Source Code

- Yoongu Kim, Weikun Yang, and Onur Mutlu,
  "Ramulator: A Fast and Extensible DRAM Simulator"
  IEEE Computer Architecture Letters ***(CAL)***, March 2015.
  [Source Code]

- Source code is released under the liberal MIT License
  - https://github.com/CMU-SAFARI/ramulator

Ramulator: A Fast and Extensible DRAM Simulator

Yoongu Kim[1] Weikun Yang[1,2] Onur Mutlu[1]
[1]Carnegie Mellon University [2]Peking University

Optional Assignment

- Review the Ramulator paper
  - Email me your review (omutlu@gmail.com)
- Download and run Ramulator
  - Compare DDR3, DDR4, SALP, HBM for the libquantum benchmark (provided in Ramulator repository)
  - Email me your report (omutlu@gmail.com)
- This **will** help you get into **memory systems research**
