Executive Summary

- **Motivation**: DRAM-based true random number generators (TRNGs) provide **true random numbers at low cost** on a **wide range** of computing systems
- **Problem**: Prior DRAM-based TRNGs are slow:
 1. Based on fundamentally slow processes → **high latency**
 2. Cannot effectively harness entropy from DRAM rows → **low throughput**
- **Goal**: Develop a **high-throughput** and **low-latency** TRNG that uses **commodity DRAM** devices
- **Key Observation**: Carefully engineered sequence of DRAM commands can activate **four DRAM rows** → **QUadruple ACTivation (QUAC)**
- **Key Idea**: Use **QUAC** to activate DRAM rows that are initialized with **conflicting data** (e.g., two '1's and two '0's) to generate random values
- **QUAC-TRNG**: DRAM-based TRNG that generates true random numbers at **high-throughput** and **low-latency** by **repeatedly performing QUAC operations**
- **Results**: We evaluate QUAC-TRNG using **136** real DDR4 chips
 1. **5.4 Gb/s** maximum (**3.4 Gb/s** average) TRNG throughput per DRAM channel
 2. Outperforms existing DRAM-based TRNGs by **15.08x** (base), and **1.41x** (enhanced)
 3. Low TRNG latency: **256-bit RN** in **274 ns**
 4. Passes **all 15** NIST randomness tests

Outline

True Random Number Generation

DRAM Background

QUadruple ACtivation (QUAC)

QUAC-TRNG

Evaluation

Random Numbers

Sequence of bits without **any discernible pattern**

Random Number Candidates

00001111

Pattern exists

01010101

Pattern exists

00101101

Pattern does not seem to exist

Producing Random Numbers

Random Number Generator (RNG)

A device/program that generates random numbers

Pseudo-Random Number Generator (PRNG)

Arithmetic Transform

If seed is compromised
random number sequence can be regenerated

True Random Number Generator (TRNG)

Physical
Process

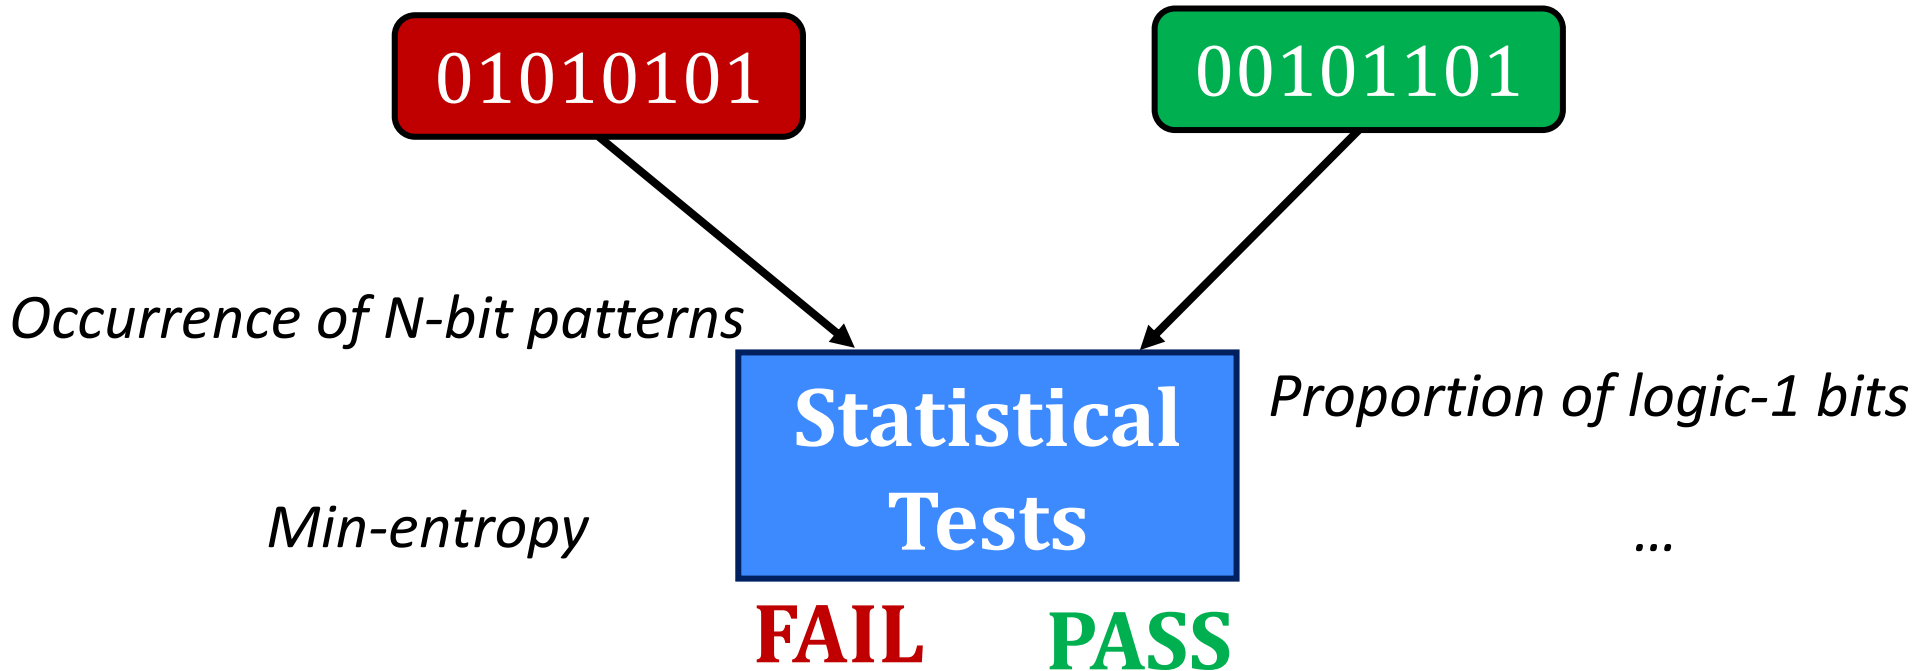

TRNG output cannot be regenerated
from the physical process

Assesing the Quality of a TRNG

Systematically distinguish between
a low-quality and **a high-quality** TRNG

Use Cases of True Random Numbers

High-quality true random numbers
are **critical** to **many applications**

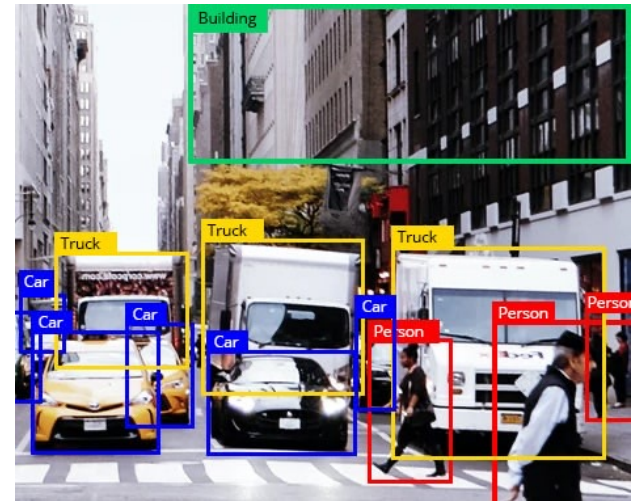

Cryptographic Key
Generation

Signature Generation

Monte Carlo
Simulations

Randomized Training

Genetic Algorithms

Generating True Random Numbers

True random numbers can **only** be obtained by sampling random physical processes

Unfortunately, **not all computing systems** are equipped with **TRNG hardware** (e.g., dedicated circuitry)

DRAM-Based TRNGs

DRAM chips are ubiquitous in modern computing platforms

DRAM-based TRNGs enable true random number generation **within DRAM chips**

DRAM-Based TRNGs

Low-cost: No specialized circuitry for RNG
Beneficial for constrained systems

High-throughput: $> Gb/s$ throughput
Enable applications that require high-throughput TRNG

Synergy with Processing-in-Memory

Processing-in-Memory (PIM) Systems

- Perform **computation** directly **within** a **memory chip**
- Improve system performance by avoiding off-chip **data movement**

[Samsung]

[UPMEM]

True random number generation within DRAM

- Enables PIM workloads to sample true random numbers **directly within the memory chip**
- Avoids inefficient communication to other possible **off-chip TRNG sources**, **enhances security & privacy**

Evaluation

Quadruple Activation (QUAC)

New Observation

Carefully-engineered DRAM commands can activate four rows in real DRAM chips

Activate four rows with two ACT commands

Quadruple Activation (QUAC)

Characteristic 1

Activates a set of four DRAM rows whose addresses **differ only** in their **two LSBs**

Quadruple Activation (QUAC)

Characteristic 2

First and second ACT's addresses must have their **two LSBs inverted**

QUAC on Real DRAM Chips

b. FPGA Board

a. DRAM Module

c. PCIe Host Interface

d. Temperature Controller

Valid QUAC behavior on
136 DDR4 chips

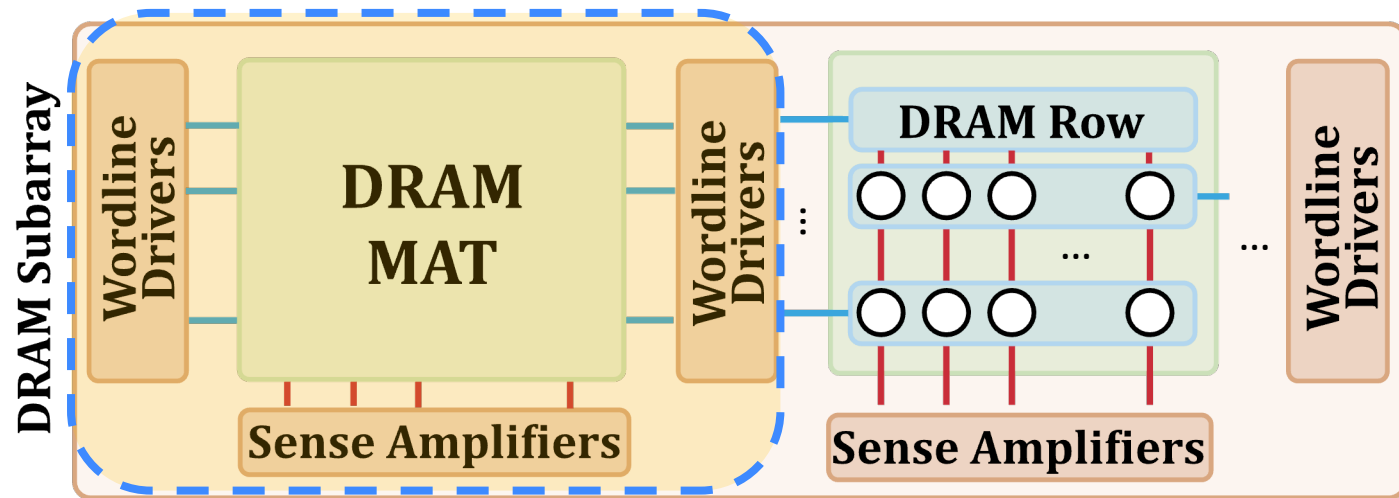

Why Does QUAC Work?

Hypothetical circuit to explain QUAC

- High *density* and *performance* requirements push for **hierarchical organization**
- Hierarchical organization of DRAM wordlines **enable *high-density* and *low-latency*** DRAM operation

Hierarchical Wordlines

A **master** wordline drives multiple **local** wordlines

Hierarchical Wordlines

A **master** wordline drives multiple **local** wordlines

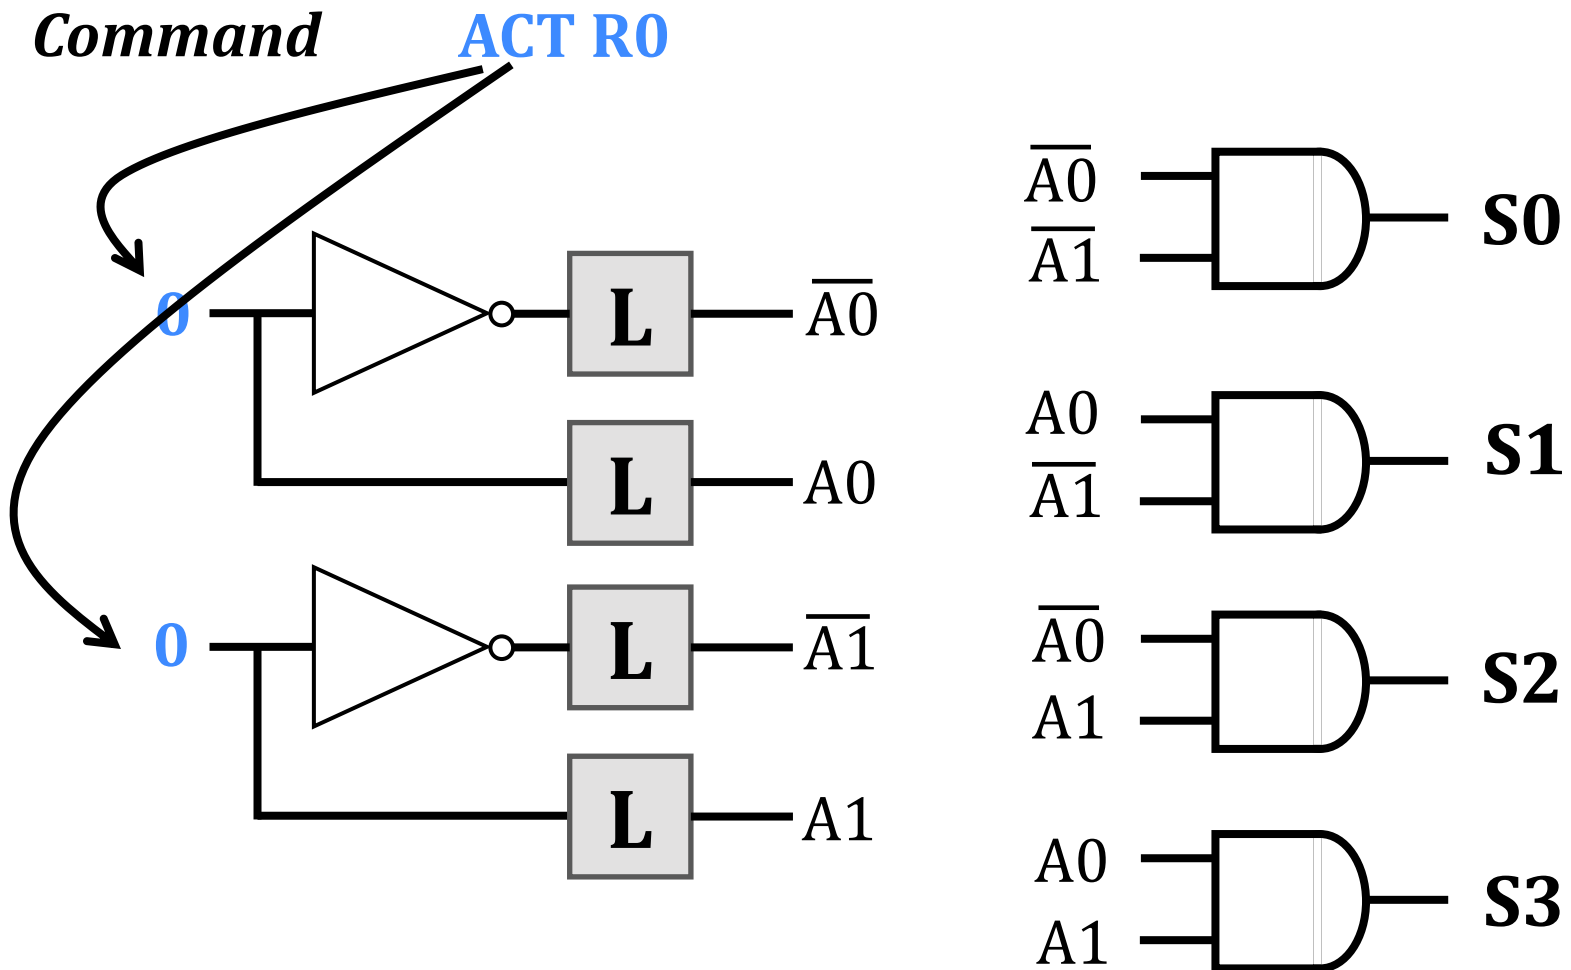

Hypothetical Row Decoder

Predecode the least significant two bits | *Drive control signals*

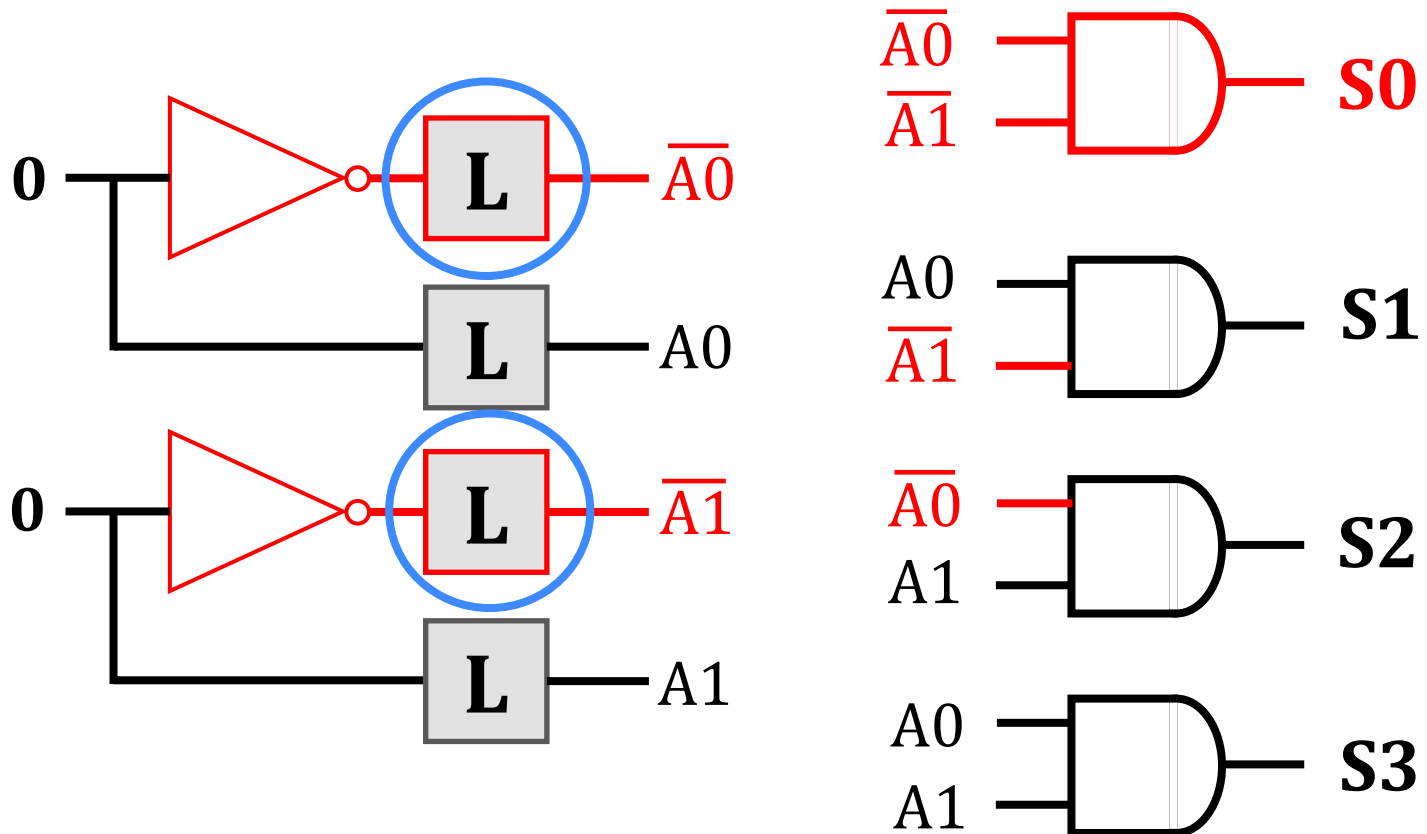

Hypothetical Row Decoder

First ACT command drives a single wordline

Hypothetical Row Decoder

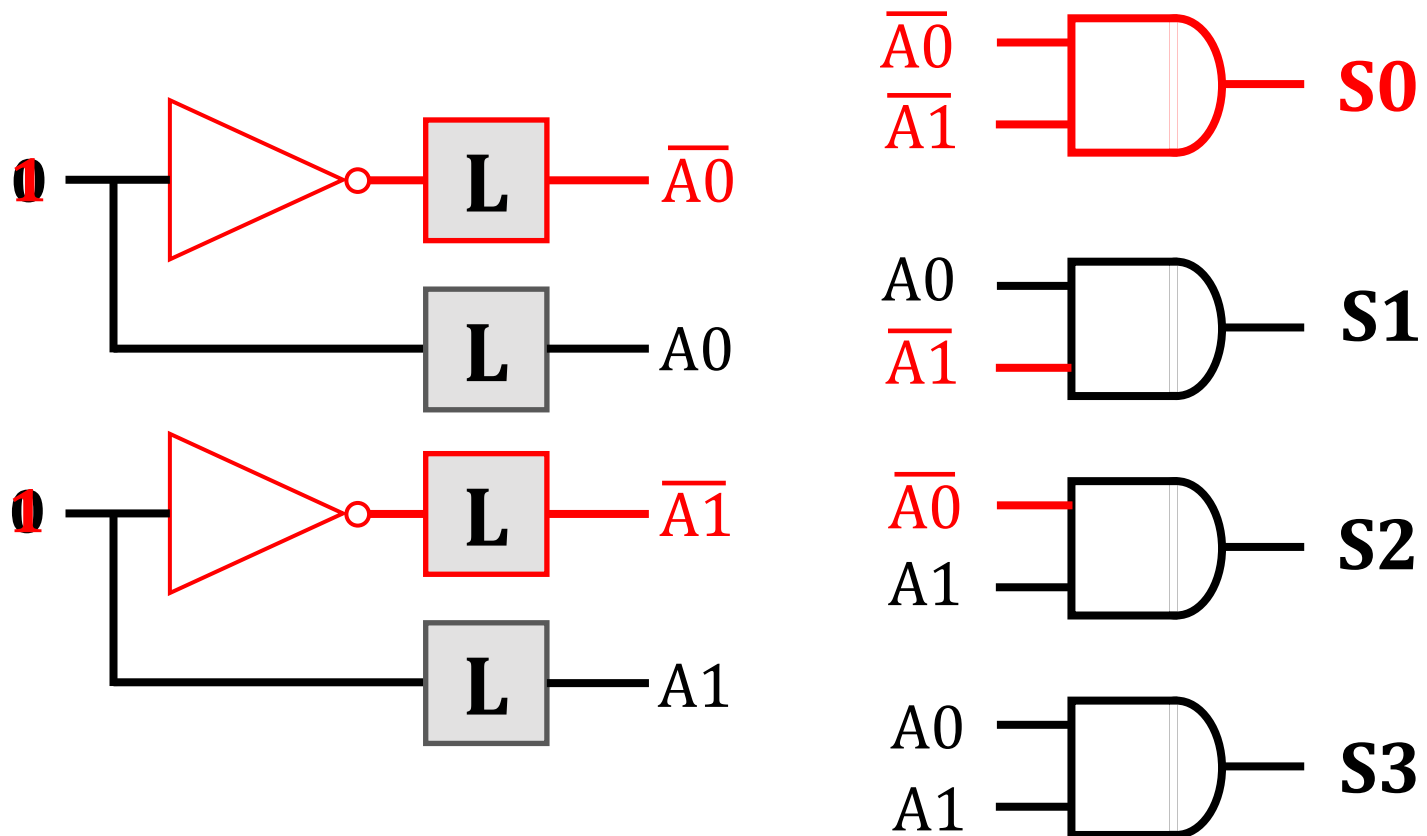

Command ACT R0 $\xrightarrow[\text{Timing}]{\text{Violate}}$ PRE

PRE command **cannot** disable latches

Hypothetical Row Decoder

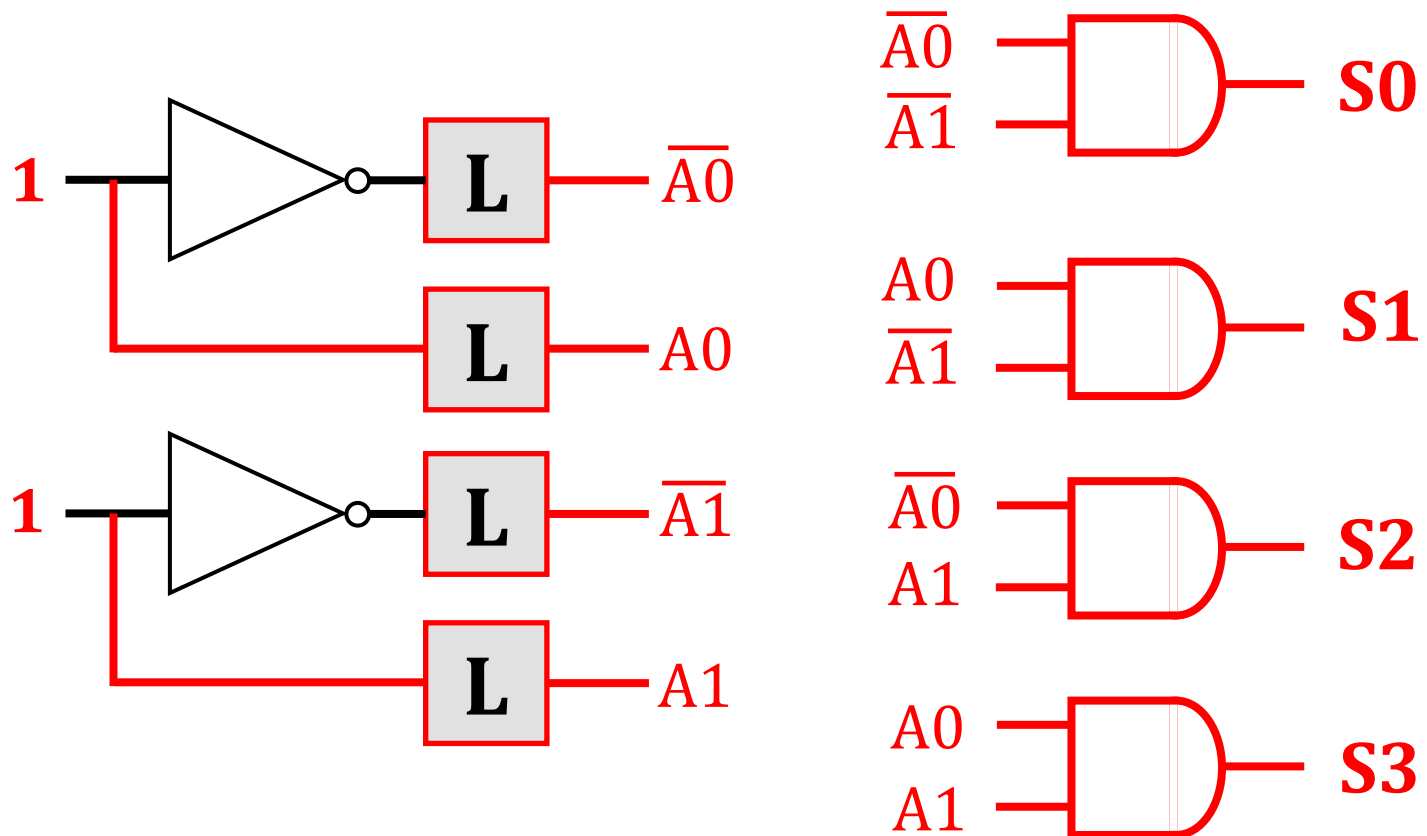

Command ACT R0 $\xrightarrow[\text{Violate Timing}]{}$ PRE $\xrightarrow[\text{Violate Timing}]{}$ ACT R3

Second ACT drives the **remaining three** wordlines

Hypothetical Row Decoder

Command ACT R0 $\xrightarrow[\text{Timing}]{\text{Violate}}$ PRE $\xrightarrow[\text{Timing}]{\text{Violate}}$ ACT R3

All four wordlines are enabled
Quadruple Activation

Evaluation

Generating Random Values via QUAC

Generating Random Values via QUAC

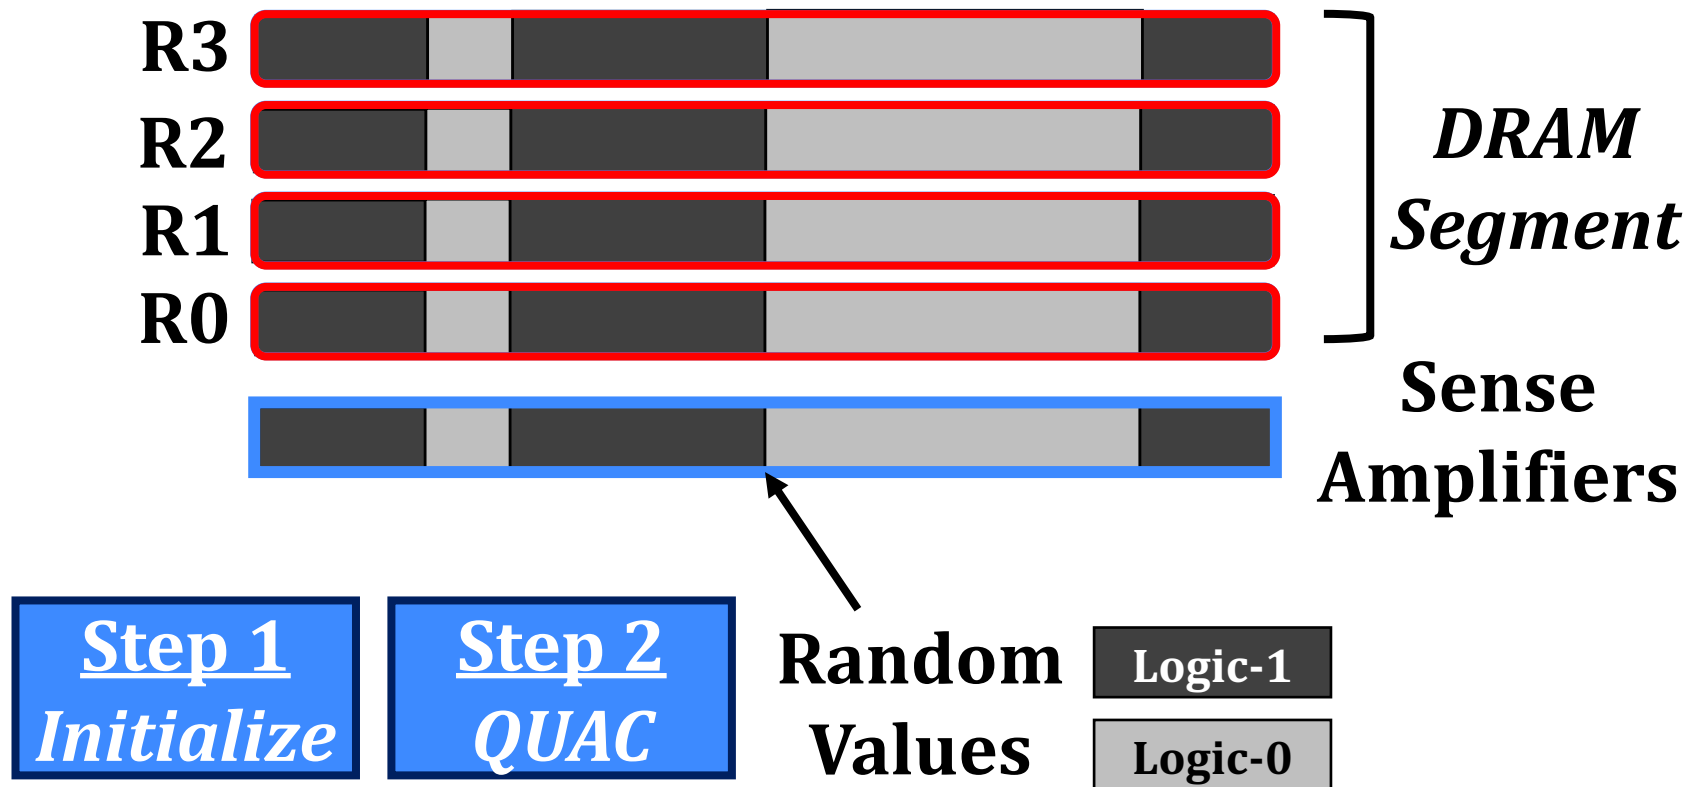

Generating Random Values via QUAC

QUAC-TRNG

Key Idea: Leverage **random values** on sense amplifiers generated by **QUAC** operations as **source of entropy**

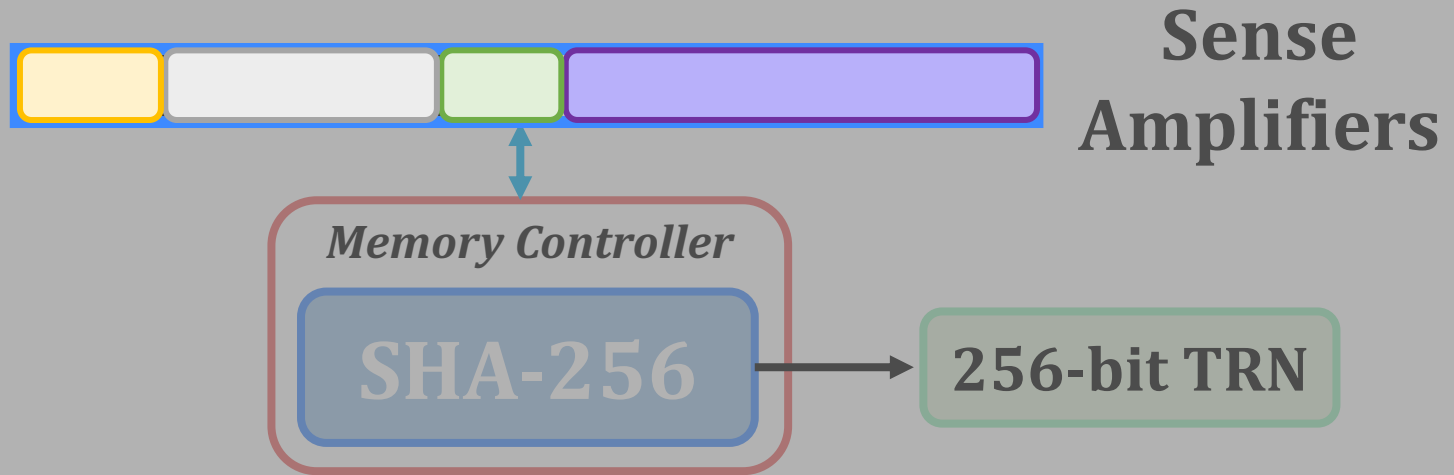

QUAC-TRNG

Key Idea: Leverage **random values** on sense amplifiers generated by **QUAC** operations as **source of entropy**

QUAC-TRNG

Key Idea: Leverage random values on sense amplifiers generated by QUAC operations as source of entropy

Generates a 256-bit random number
for every 256-bit Shannon Entropy block

Outline

True Random Numbers in DRAM

DRAM Background

QUadruple ACtivation (QUAC)

QUAC-TRNG

Evaluation

Real Chip Characterization

Experimentally study QUAC and QUAC-TRNG using 136 real DDR4 chips from SK Hynix

DDR4 DRAM Bender → DRAM Testing Infrastructure

Real Chip Characterization

Measure randomness of bitstreams using
Shannon Entropy

$$H(x) = - \sum_{i=1}^2 p(x_i) \log_2 p(x_i) \rightarrow \text{Calculating probabilities:}$$

Proportion of *logic-1* and *logic-0* values in the random bitstream

Sample each bitline following QUAC *1000 times* and calculate the bitline's Shannon Entropy

$$\text{SE}(1111...111) = 0$$

$$0 < \text{SE}(1001...010) < 1$$

Real Chip Characterization

At 50°C and nominal voltage:

Repeatedly perform QUAC 1000 times and measure the Shannon Entropy of each bitline in 8K DRAM Segments (32K DRAM Rows), using all 16 different four-bit data patterns

Data pattern: 1111 (four ones)

Data pattern: 1000

Data Pattern Dependence

Calculate *cache block entropy (CBE)*

$$\sum \text{all bitline entropies in the cache block}$$

Metrics based on CBE:

1. **Average CBE:** *Average* entropy across all cache blocks in a module
2. **Maximum CBE:** *Maximum* of the cache block entropies in a module

Data Pattern Dependence

Entropy varies with data pattern

Highest average entropy with pattern “0111”

Spatial Distribution

Segment entropy = \sum *all bitline entropies in the segment*

Segment entropy behavior is different
for different modules

Spatial Distribution

Segment entropy = \sum *all bitline entropies in the segment*

Entropy significantly increases towards the end of the DRAM bank

Takeaways: QUAC Entropy

We observe that entropy resulting from QUAC operations changes according to the

- data pattern used in initialization
- physical location of DRAM segments

attributed to:

- systematic manufacturing process variation
- design-induced variation

QUAC-TRNG's Quality

Two experiments to measure **quality**

1 QUAC + lightweight post-processing

To see if QUACs produce **high-quality**
random values on **sense amplifiers**

2 QUAC-TRNG using SHA-256

To evaluate QUAC-TRNG's quality

Use **NIST STS** to evaluate quality

NIST Results

Table 1: NIST STS Randomness Test Results

NIST STS Test	VNC* (p-value)	SHA-256 (p-value)
monobit	0.430	0.500
frequency_within_block	0.408	0.528

random_excursion_variant	0.116	0.510

*VNC: Von Neumann Corrector

QUAC-TRNG Throughput Estimation

Estimate QUAC-TRNG's throughput according to:

$$(256 \times SIB) / (L \times 10^{-9}) \text{ bps}$$

SIB: # of **SHA Input Blocks** in the **highest-entropy segment**

L: Latency of one QUAC operation in nanoseconds

QUAC-TRNG Throughput Estimation

Estimate QUAC-TRNG's throughput according to:

$$(256 \times SIB) / (L \times 10^{-9}) \text{ bps}$$

SIB: # of **SHA Input Blocks** in the **highest-entropy segment**

L: Latency of one QUAC operation in nanoseconds

QUAC-TRNG Throughput Estimation

Estimate QUAC-TRNG's throughput according to:

$$(256 \times SIB) / (L \times 10^{-9}) \text{ bps}$$

SIB: # of **SHA Input Blocks** in the **highest-entropy segment**

L: Latency of one QUAC operation in nanoseconds

QUAC-TRNG Throughput Estimation

Estimate QUAC-TRNG's throughput according to:

$$(256 \times SIB) / (L \times 10^{-9}) \text{ bps}$$

SIB: # of **SHA Input Blocks** in the **highest-entropy segment**

L: Latency of one QUAC operation in nanoseconds

QUAC-TRNG Configurations

- 1** **One Bank** Use a *single* DRAM bank
- 2** **BGP** **Bank Group-Level Parallelism**
Use *four* banks from different bank groups
- 3** **RC + BGP** **RowClone + BGP**
Use *in-DRAM* copy to initialize DRAM rows *and* use four banks from *different* bank groups

QUAC-TRNG Throughput

Achieves **3.44 Gb/s** throughput **per DRAM channel** on average across all modules

In-DRAM initialization greatly improves throughput

QUAC-TRNG vs State-Of-The-Art

High-throughput DRAM-based TRNGs:

- **D-RaNGe**: Activation latency failures
- **Talukder et. al**: Precharge latency failures

Calculate throughput by **tightly scheduling the DDR4 commands** required to induce failures

Evaluate two versions of these past two works:

- **Base**: As proposed
- **Enhanced (Fair)**: Throughput-optimized (SHA-256)

Assume four-channel DDR4 memory

QUAC-TRNG vs State-Of-The-Art

Outperforms best prior DRAM-based TRNG

(i) “base” by **15.08x** at **2.4 GT/s**

(ii) “enhanced” by **2.03x** at **12 GT/s**

More in the Paper

- NIST randomness tests results
- Throughput & latency comparison against four other DRAM-based TRNGs
- System Integration
 - How QUAC-TRNG can be implemented in real systems
 - System performance study
 - QUAC-TRNG's throughput with concurrently running applications
 - Area overhead: 0.04% of a contemporary CPU (7 nm)
 - Memory overhead: 0.002% of an 8 GiB DRAM module
- Sensitivity Analysis
 - Effect of temperature on QUAC's entropy
 - Entropy changes with temperature
 - Time dependence study
 - Entropy remains stable for at least up to a month

True Random Number Generators

Sample random physical phenomena

Post-processing for TRNGs

Bias in entropy source → bias in TRNG output

- Low quality (statistically) random numbers

Post-processing to remove bias

- Improve TRNG quality

Entropy Sources in DRAM

1

Retention Failures

Fundamentally Slow: cells leak charge slowly

Entropy Sources in DRAM

1

Retention Failures

Fundamentally Slow: cells leak charge slowly

2

Start-up Values

Fundamentally Slow: requires power-cycle

3

Timing Failures

Fast: limited by DRAM command latencies

SHA-256 and Von Neumann Corrector

Cryptographic Hash Functions

Von Neumann Corrector

Timing Failure-based TRNGs

1

D-RaNGe

Activation latency (tRCD) failures

J. S. Kim, M. Patel, H. Hassan, L. Orosa and O. Mutlu,

"D-RaNGe: Using Commodity DRAM Devices to Generate True Random Numbers with Low Latency and High Throughput," HPCA, 2019

2

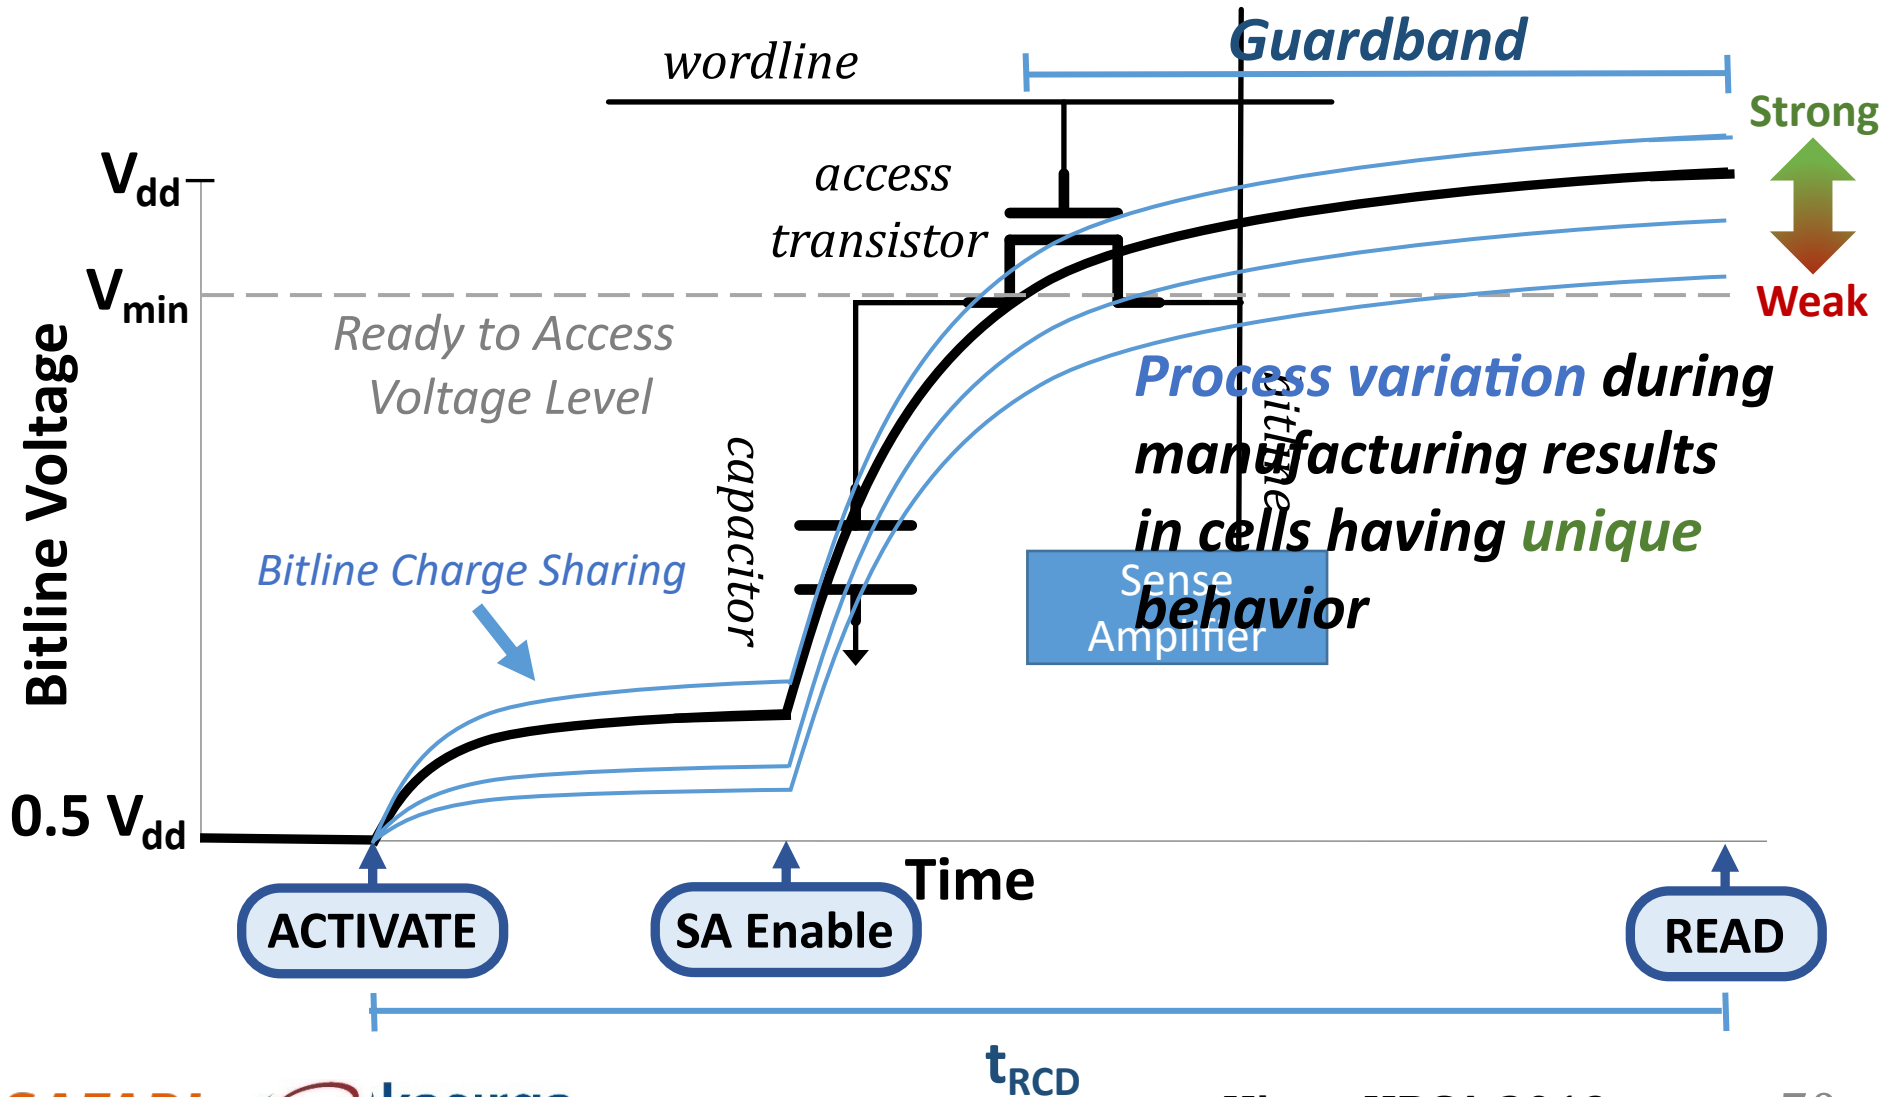

Talukder et al.

Precharge latency (tRP) failures

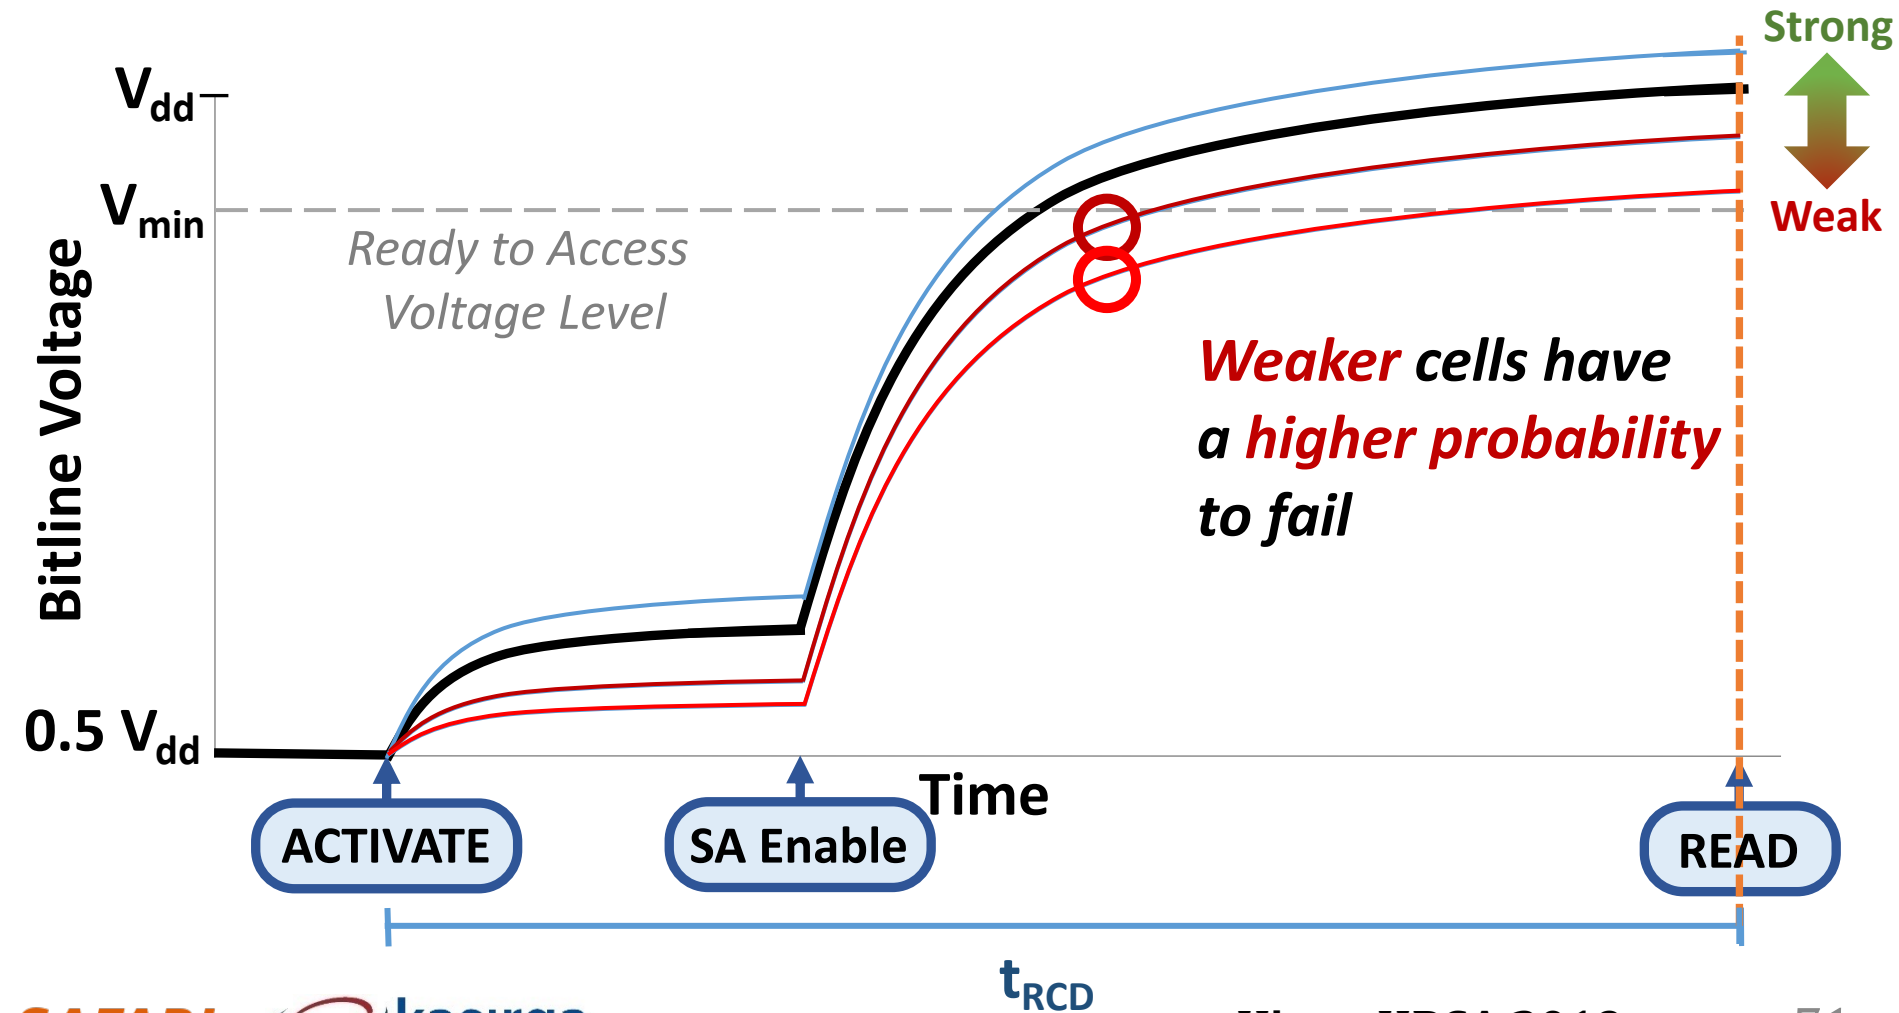

B. M. S. Bahar Talukder, J. Kerns, B. Ray, T. Morris and M. T. Rahman,

"Exploiting DRAM Latency Variations for Generating True Random Numbers," ICCE, 2019

D-RaNGe: Accessing a Cell

D-RaNGe: Accessing a Cell

D-RaNGe Key Idea

High % chance to fail
with reduced t_{RCD}

Low % chance to fail
with reduced t_{RCD}

D-RaNGe Key Idea

High % chance to fail

Low % chance to fail

The **key idea** is to extract **random values**
by sampling DRAM cells that fail
truly randomly

Key Idea: Sample DRAM cells that fail randomly, but with reduced t_{RP}

Limitations of State-of-the-art

D-RaNGe

- Poorly utilizes activation granularity

→ Induce failures within 0.8% of cells

- Throughput limited by access latency

Limitations of State-of-the-art

Talukder et al.

- Well utilizes activation granularity
- *Cannot* induce metastability on many sense amplifiers

DRAM Sense Amplifiers / Row Buffer

- Random bits distributed scarcely over the row buffer
- Throughput limited by poor-quality randomness source

Limitations of State-of-the-art

Talukder et al.

- Well utilizes activation granularity
- *Cannot* induce metastability on many sense amplifiers

A **high-throughput** DRAM TRNG needs to:

- (i) well utilize **activation granularity**
- (ii) induce metastability on **many sense amplifiers**

- Throughput **limited by poor-quality randomness source**

System Performance Study

The maximum throughput QUAC-TRNG provides without reducing the total off-chip memory bandwidth

Ramulator: 3.2 GHz core, *four-channel* DDR4 memory

QUAC-TRNG achieves **74.1%** of the empirical average throughput

Throughput & Latency Comparison

Table 2: Summary of prior DRAM-TRNGs vs QUAC-TRNG

Proposal	Entropy Source	TRNG Throughput	256-bit TRNG Latency
QUAC-TRNG	Quadruple ACT	13.76 Gb/s	274 ns
Talukder+ [15]	Precharge Failure	0.68 - 6.13 Gb/s	249 ns - 201 ns
D-RaNGe [88]	Activation Failure	0.92 - 9.73 Gb/s	260 ns - 36 ns
D-PUF [150]	Retention Failure	0.20 Mb/s	40 s
DRNG [47]	DRAM Start-up	N/A	700 μ s
Keller+ [81]	Retention Failure	0.025 Mb/s	40 s
Pyo+ [126]	DRAM Cmd Schedule	2.17 Mb/s	112.5 μ s

Based on fundamentally slow processes

Memory Overhead

The memory allocated for QUAC-TRNG is only **192 KiBs per DRAM module**

- **Four segments** for QUAC (128 KiB)
- **Eight DRAM rows** for bulk initialization (64 KiB)
- **0.002%** of the capacity of an **8 GB DDR4** DIMM.

Area Overhead

Require 326 bits of storage per DRAM channel

- Four DRAM addresses to point to segments (72 bits)
- Eight addresses to point to initialization operands (144 bits)
- 11 column addresses →
256-bit total entropy cache block ranges (110 bits)

Model storage using CACTI:

- 0.0003 mm² for storage

0.0011 mm² for the SHA-256 engine

0.04% of a Zen 2 CPU (7 nm)

Sensitivity Study

Temperature Dependence

Record bitline entropy at 50, 65 and 85°C

Time Dependence

Record entropy at *the beginning* and *the end* of a 30-day period

Both studies use 5 DRAM modules and the “0111” data pattern

Temperature Dependence

Observe two temperature dependence trends

Entropy changes with temperature

Time Dependence

Entropy difference between the beginning and the end of the 30-day period:

- 2.4% average across all chips
- Maximum difference is 5.2% (minimum is 0.9%)

Characterized entropy is valid for at least 30 days

DDR4 Modules
