Seminar in Computer Architecture

Meeting 1: Introduction

Prof. Onur Mutlu

ETH Zürich

Fall 2020

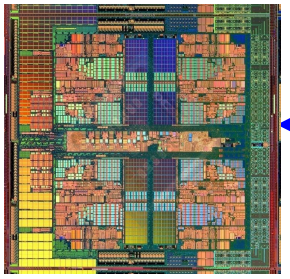
17 September 2020

Brief Self Introduction

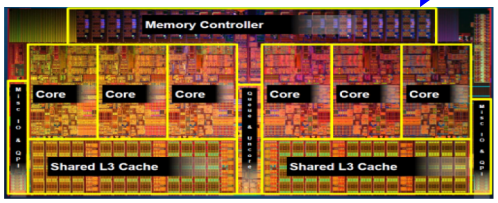
- Onur Mutlu
  - Full Professor @ ETH Zurich ITET (INFK), since September 2015
  - Strecker Professor @ Carnegie Mellon University ECE/CS, 2009-2016, 2016-…
  - PhD from UT-Austin, worked at Google, VMware, Microsoft Research, Intel, AMD
  - https://people.inf.ethz.ch/omutlu/
  - omutlu@gmail.com (Best way to reach me)
  - https://people.inf.ethz.ch/omutlu/projects.htm
- Research and Teaching in:
  - Computer architecture, computer systems, hardware security, bioinformatics
  - Memory and storage systems
  - Hardware security, safety, predictability
  - Fault tolerance
  - Hardware/software cooperation
  - Architectures for bioinformatics, health, medicine
  - …

Current Research Mission

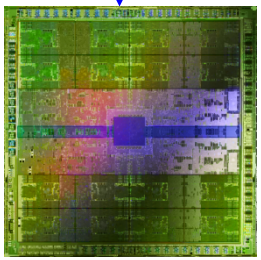
Computer architecture, HW/SW, systems, bioinformatics, security



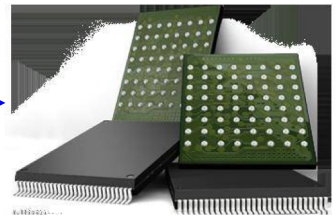
Heterogeneous Processors and Accelerators



Hybrid Main Memory



Graphics and Vision Processing



Persistent Memory/Storage

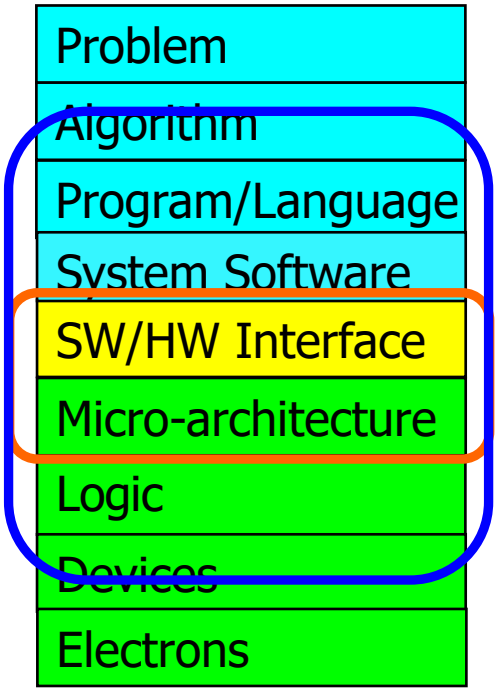
Build fundamentally better architectures

Four Key Current Directions

- Fundamentally Secure/Reliable/Safe Architectures
- Fundamentally Energy-Efficient Architectures
  - Memory-centric (Data-centric) Architectures
- Fundamentally Low-Latency and Predictable Architectures
- Architectures for AI/ML, Genomics, Medicine, Health

The Transformation Hierarchy

Computer Architecture (expanded view)



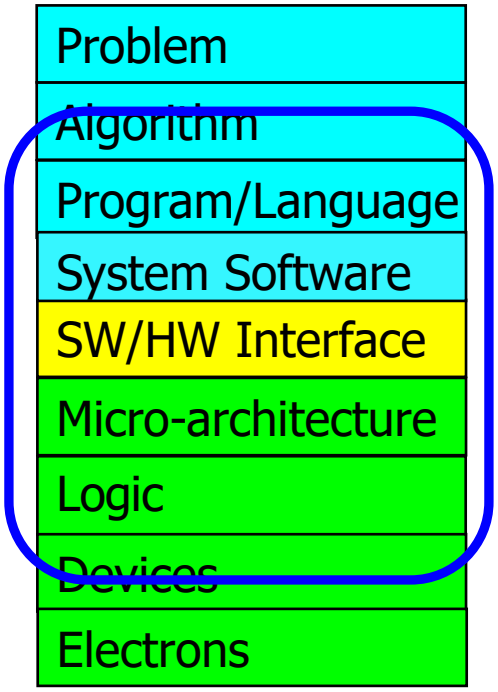
Computer Architecture (narrow view)

Axiom

To achieve the highest energy efficiency and performance:

we must take the expanded view

of computer architecture

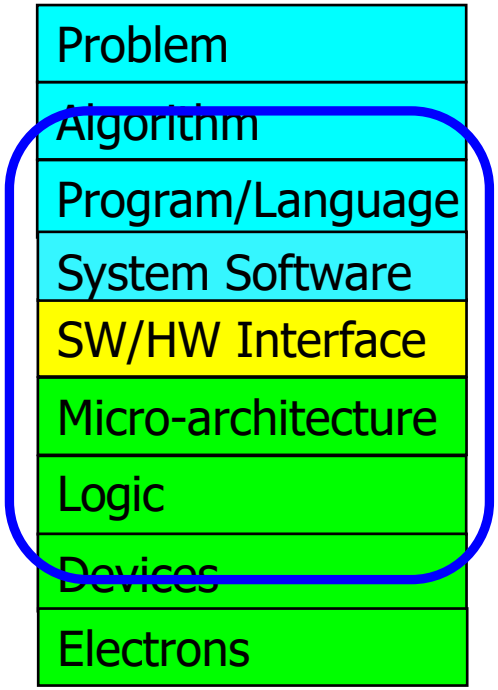


Co-design across the hierarchy: Algorithms to devices

Specialize as much as possible within the design goals

Current Research Mission & Major Topics

Build fundamentally better architectures



Broad research spanning apps, systems, logic with architecture at the center

- Data-centric arch. for low energy & high perf.
  - Proc. in Mem/DRAM, NVM, unified mem/storage
- Low-latency & predictable architectures
  - Low-latency, low-energy yet low-cost memory
  - QoS-aware and predictable memory systems
- Fundamentally secure/reliable/safe arch.
  - Tolerating all bit flips; patchable HW; secure mem
- Architectures for ML/AI/Genomics/Graph/Med
  - Algorithm/arch./logic co-design; full heterogeneity
- Data-driven and data-aware architectures
  - ML/AI-driven architectural controllers and design
  - Expressive memory and expressive systems

Onur Mutlu's SAFARI Research Group

Computer architecture, HW/SW, systems, bioinformatics, security, memory

Why Study Computer Architecture?

Computer Architecture

- is the science and art of designing computing platforms (hardware, interface, system SW, and programming model)

- to achieve a set of design goals
  - E.g., highest performance on earth on workloads X, Y, Z
  - E.g., longest battery life at a form factor that fits in your pocket with cost < $$$ CHF
  - E.g., best average performance across all known workloads at the best performance/cost ratio
  - …

  - Designing a supercomputer is different from designing a smartphone → But, many fundamental principles are similar

Different Platforms, Different Goals

Different Platforms, Different Goals

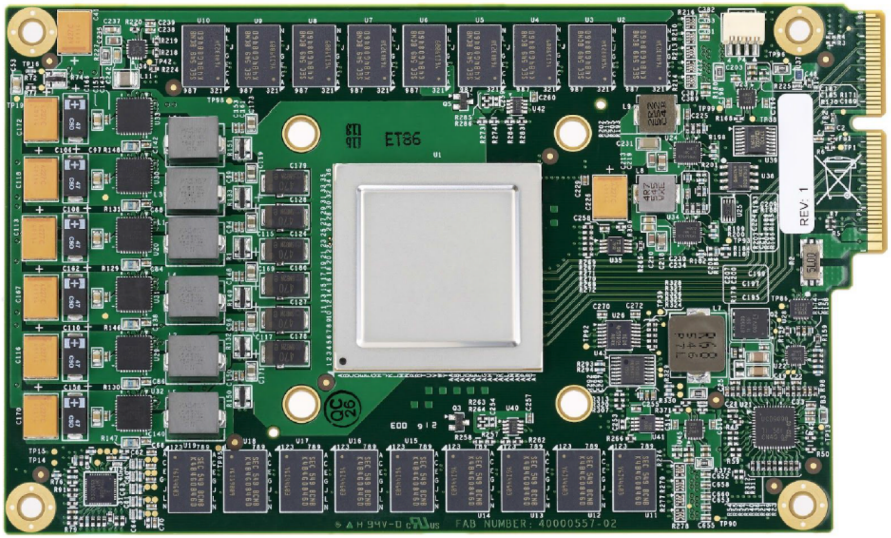

Figure 3. TPU Printed Circuit Board. It can be inserted in the slot for an SATA disk in a server, but the card uses PCIe Gen3 x16.

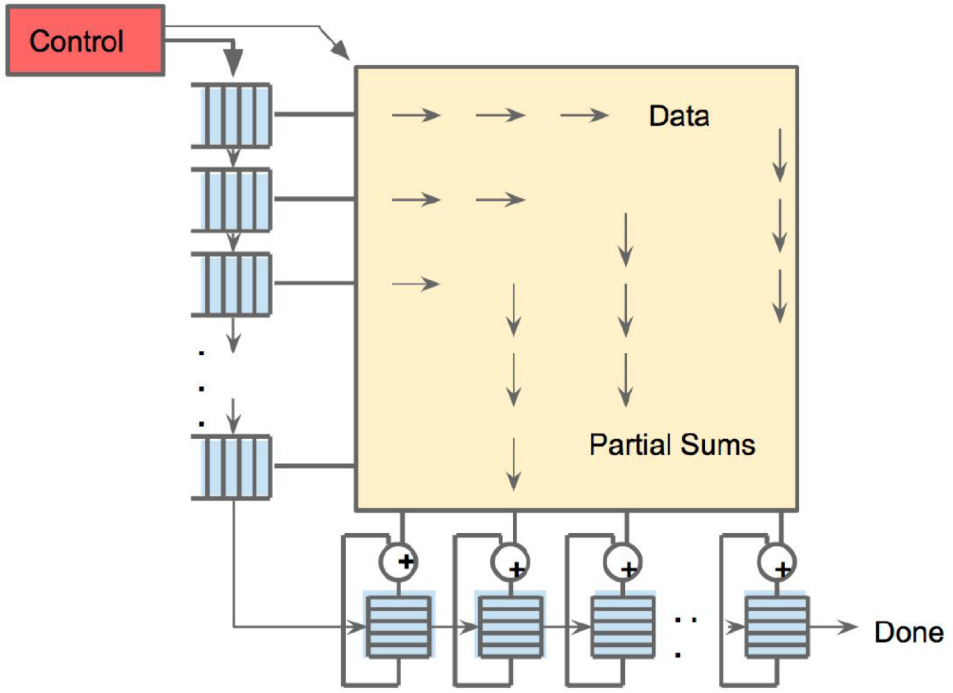

Figure 4. Systolic data flow of the Matrix Multiply Unit. Software has the illusion that each 256B input is read at once, and they instantly update one location of each of 256 accumulator RAMs.

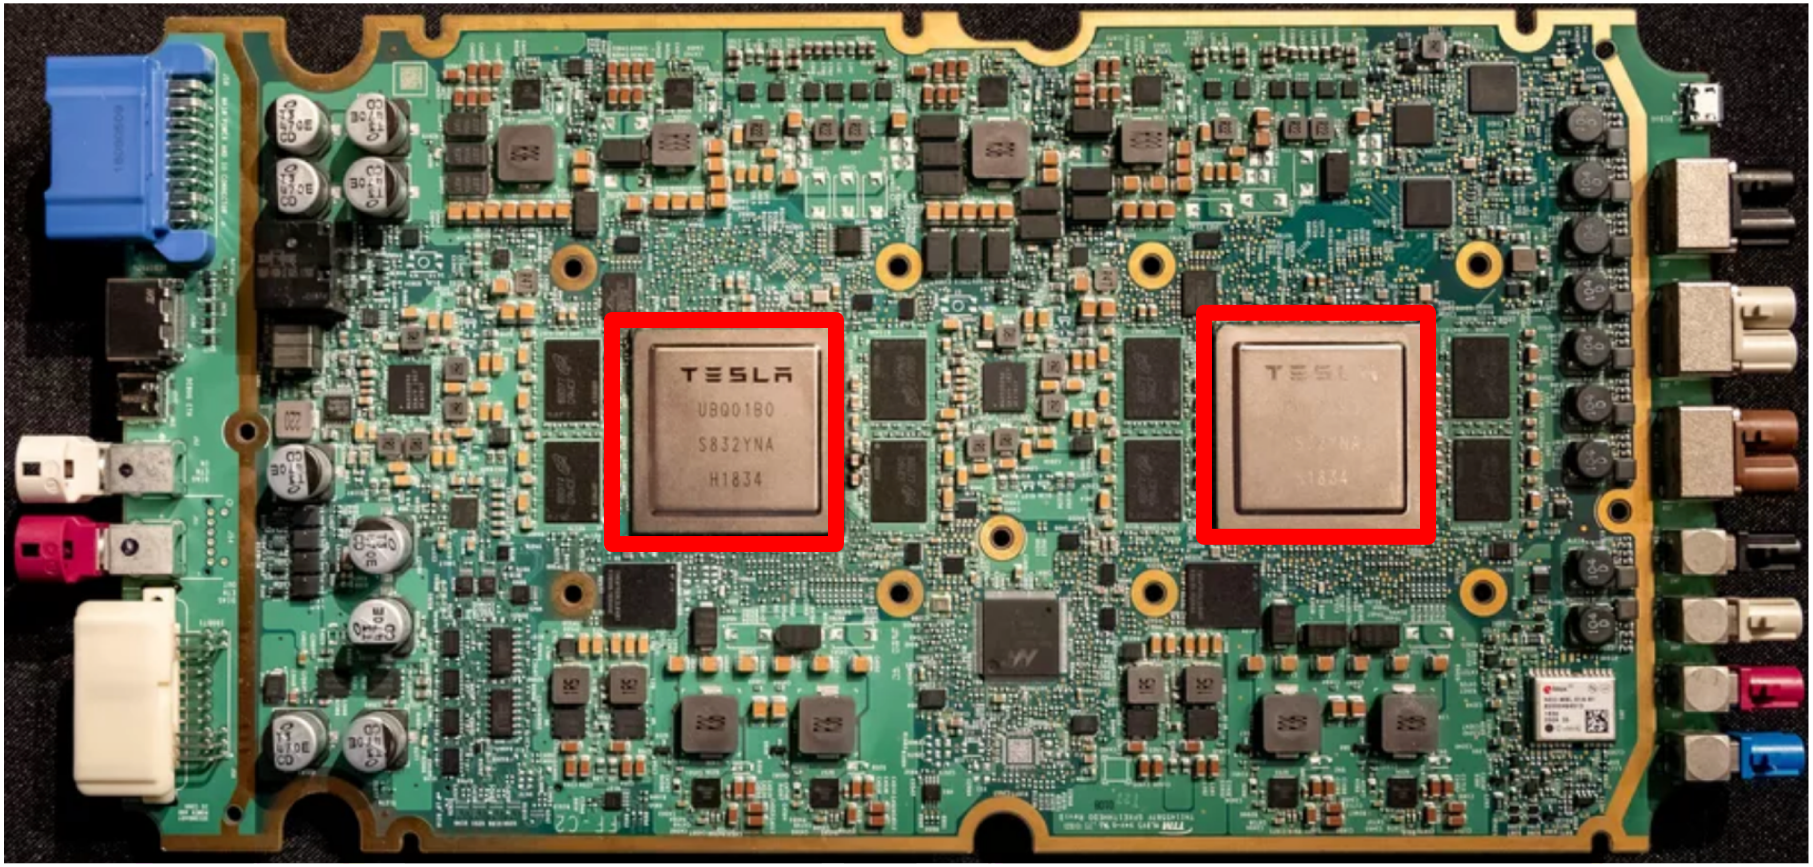
Jouppi et al., "In-Datacenter Performance Analysis of a Tensor Processing Unit", ISCA 2017.

Different Platforms, Different Goals

- ML accelerator: 260 mm^2, 6 billion transistors, 600 GFLOPS GPU, 12 ARM 2.2 GHz CPUs.
- Two redundant chips for better safety.



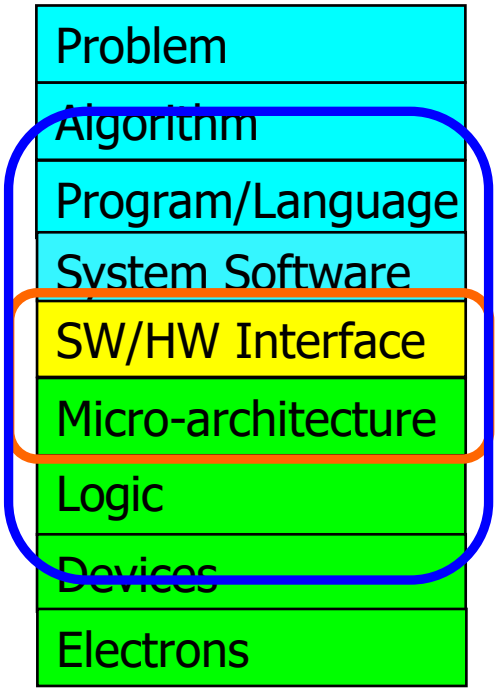
https://youtu.be/Ucp0TTmvqOE?t=4236

What is Computer Architecture?

- The science and art of designing, selecting, and interconnecting hardware components and designing the hardware/software interface to create a computing system that meets functional, performance, energy consumption, cost, and other specific goals.

The Transformation Hierarchy

Computer Architecture (expanded view)



Computer Architecture (narrow view)

Why Study Computer Architecture?

- Enable better systems: make computers faster, cheaper, smaller, more reliable, …
  - By exploiting advances and changes in underlying technology/circuits
- Enable new applications
  - Life-like 3D visualization 20 years ago? Virtual reality?
  - Self-driving cars?
  - Personalized genomics? Personalized medicine?
- Enable better solutions to problems
  - Software innovation is built on trends and changes in computer architecture
    - > 50% performance improvement per year has enabled this innovation
- Understand why computers work the way they do

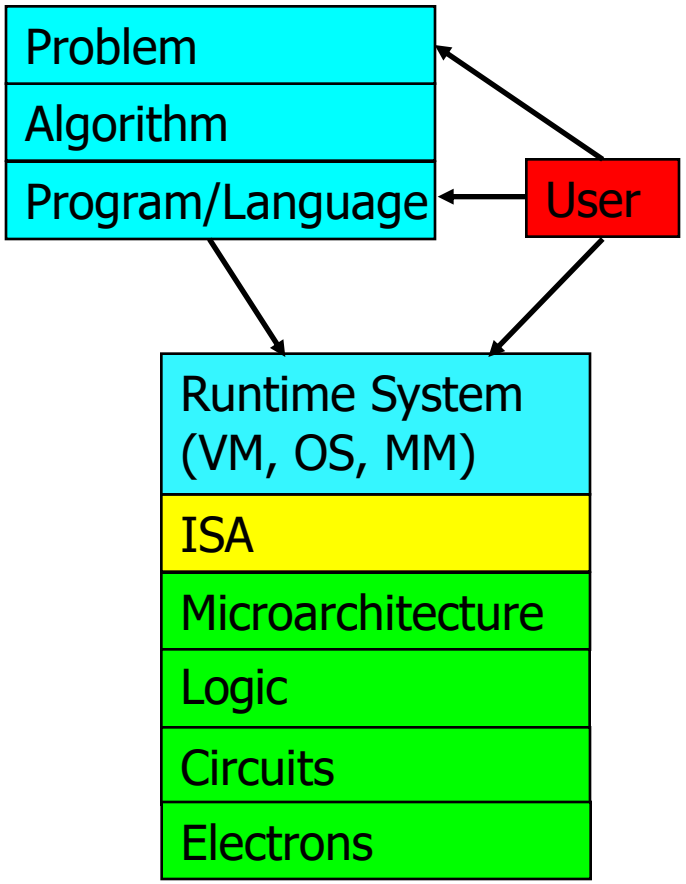
Computer Architecture Today (I)

- Today is a very exciting time to study computer architecture
- Industry is in a large paradigm shift (to novel architectures) – many different potential system designs possible
- Many difficult problems *motivating* and *caused by* the shift
  - Huge hunger for data and new data-intensive applications
  - Power/energy/thermal constraints
  - Complexity of design
  - Difficulties in technology scaling
  - Memory bottleneck
  - Reliability problems
  - Programmability problems
  - Security and privacy issues
- No clear, definitive answers to these problems

Computer Architecture Today (II)

- These problems affect all parts of the computing stack – if we do not change the way we design systems

Many new demands from the top (Look Up)



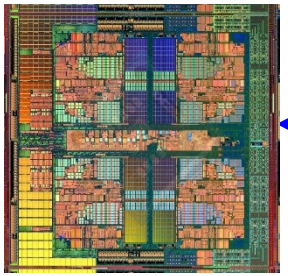
Fast changing demands and personalities of users (Look Up)

Many new issues at the bottom (Look Down)

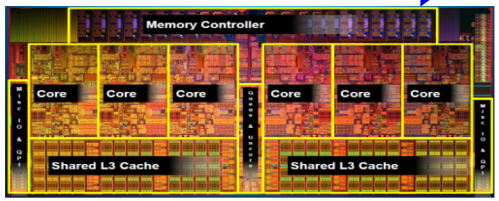
- No clear, definitive answers to these problems

Computer Architecture Today (III)

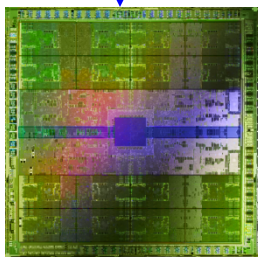
- Computing landscape is very different from 10-20 years ago
- Both UP (software and humanity trends) and DOWN (technologies and their issues), FORWARD and BACKWARD, and the resulting requirements and constraints



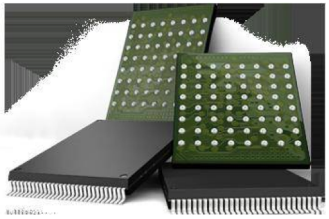
Heterogeneous Processors and Accelerators



Hybrid Main Memory



General Purpose GPUs



Persistent Memory/Storage

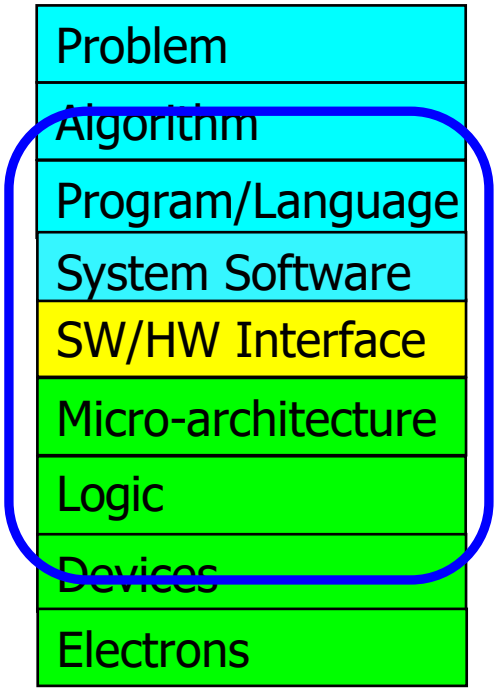
Every component and its interfaces, as well as entire system designs are being re-examined

Axiom

To achieve the highest energy efficiency and performance:

we must take the expanded view

of computer architecture



Co-design across the hierarchy: Algorithms to devices

Specialize as much as possible within the design goals

Historical: Opportunities at the Bottom

There's Plenty of Room at the Bottom

From Wikipedia, the free encyclopedia

"**There's Plenty of Room at the Bottom: An Invitation to Enter a New Field of Physics**" was a lecture given by physicist Richard Feynman at the annual American Physical Society meeting at Caltech on December 29, 1959.[1] Feynman considered the possibility of direct manipulation of individual atoms as a more powerful form of synthetic chemistry than those used at the time. Although versions of the talk were reprinted in a few popular magazines, it went largely unnoticed and did not inspire the conceptual beginnings of the field. Beginning in the 1980s, nanotechnology advocates cited it to establish the scientific credibility of their work.

https://en.wikipedia.org/wiki/There%27s_Plenty_of_Room_at_the_Bottom

Historical: Opportunities at the Bottom (II)

There's Plenty of Room at the Bottom

From Wikipedia, the free encyclopedia

Feynman considered some ramifications of a general ability to manipulate matter on an atomic scale. He was particularly interested in the possibilities of denser computer circuitry, and microscopes that could see things much smaller than is possible with scanning electron microscopes. These ideas were later realized by the use of the scanning tunneling microscope, the atomic force microscope and other examples of scanning probe microscopy and storage systems such as Millipede, created by researchers at IBM.

Feynman also suggested that it should be possible, in principle, to make nanoscale machines that "arrange the atoms the way we want", and do chemical synthesis by mechanical manipulation.

He also presented the possibility of "swallowing the doctor", an idea that he credited in the essay to his friend and graduate student Albert Hibbs. This concept involved building a tiny, swallowable surgical robot.

https://en.wikipedia.org/wiki/There%27s_Plenty_of_Room_at_the_Bottom

Historical: Opportunities at the Top

REVIEW

There's plenty of room at the Top: What will drive computer performance after Moore's law?

Charles E. Leiserson[1], Neil C. Thompson[1,2,*], Joel S. Emer[1,3], Bradley C. Kuszmaul[1,†], Butler W. Lampson[1,4], ...

Science 05 Jun 2020:
Vol. 368, Issue 6495, eaam9744
DOI: 10.1126/science.aam9744

Much of the improvement in computer performance comes from decades of miniaturization of computer components, a trend that was foreseen by the Nobel Prize–winning physicist Richard Feynman in his 1959 address, "There's Plenty of Room at the Bottom," to the American Physical Society. In 1975, Intel founder Gordon Moore predicted the regularity of this miniaturization trend, now called Moore's law, which, until recently, doubled the number of transistors on computer chips every 2 years.

Unfortunately, semiconductor miniaturization is running out of steam as a viable way to grow computer performance—there isn't much more room at the "Bottom." If growth in computing power stalls, practically all industries will face challenges to their productivity. Nevertheless, opportunities for growth in computing performance will still be available, especially at the "Top" of the computing-technology stack: software, algorithms, and hardware architecture.

https://science.sciencemag.org/content/368/6495/eaam9744

Axiom, Revisited

There is plenty of room both at the top and at the bottom

but much more so

when you communicate well between and optimize across

the top and the bottom.

Hence the Expanded View

Computer Architecture (expanded view)

X-MeM Aids Many Optimizations

Table 1: Summary of the example memory optimizations that XMem aids.

Memory optimization	Example semantics provided by XMem (described in §3.3)	Example Benefits of XMem
Cache management	*(i)* Distinguishing between data structures or pools of similar data; *(ii)* Working set size; *(iii)* Data reuse	Enables: *(i)* applying different caching policies to different data structures or pools of data; *(ii)* avoiding cache thrashing by *knowing* the active working set size; *(iii)* bypassing/prioritizing data that has no/high reuse. (§5)
Page placement in DRAM e.g., [23, 24]	*(i)* Distinguishing between data structures; *(ii)* Access pattern; *(iii)* Access intensity	Enables page placement at the *data structure* granularity to *(i)* isolate data structures that have high row buffer locality and *(ii)* spread out concurrently-accessed irregular data structures across banks and channels to improve parallelism. (§6)
Cache/memory compression e.g., [25–32]	*(i)* Data type: integer, float, char; *(ii)* Data properties: sparse, pointer, data index	Enables using a *different compression algorithm* for each data structure based on data type and data properties, e.g., sparse data encodings, FP-specific compression, delta-based compression for pointers [27].
Data prefetching e.g., [33–36]	*(i)* Access pattern: strided, irregular, irregular but repeated (e.g., graphs), access stride; *(ii)* Data type: index, pointer	Enables *(i) highly accurate* software-driven prefetching while leveraging the benefits of hardware prefetching (e.g., by being memory bandwidth-aware, avoiding cache thrashing); *(ii)* using different prefetcher *types* for different data structures: e.g., stride [33], tile-based [20], pattern-based [34–37], data-based for indices/pointers [38, 39], etc.
DRAM cache management e.g., [40–46]	*(i)* Access intensity; *(ii)* Data reuse; *(iii)* Working set size	*(i)* Helps avoid cache thrashing by knowing working set size [44]; *(ii)* Better DRAM cache management via reuse behavior and access intensity information.
Approximation in memory e.g., [47–53]	*(i)* Distinguishing between pools of similar data; *(ii)* Data properties: tolerance towards approximation	Enables *(i)* each memory component to track how approximable data is (at a fine granularity) to inform approximation techniques; *(ii)* data placement in heterogeneous reliability memories [54].
Data placement: NUMA systems e.g., [55, 56]	*(i)* Data partitioning across threads (i.e., relating data to threads that access it); *(ii)* Read-Write properties	Reduces the need for profiling or data migration *(i)* to co-locate data with threads that access it and *(ii)* to identify Read-Only data, thereby enabling techniques such as replication.
Data placement: hybrid memories e.g., [16, 57, 58]	*(i)* Read-Write properties (Read-Only/Read-Write); *(ii)* Access intensity; *(iii)* Data structure size; *(iv)* Access pattern	Avoids the need for profiling/migration of data in hybrid memories to *(i)* effectively manage the asymmetric read-write properties in NVM (e.g., placing Read-Only data in the NVM) [16, 57]; *(ii)* make tradeoffs between data structure "hotness" and size to allocate fast/high bandwidth memory [14]; and *(iii)* leverage row-buffer locality in placement based on access pattern [45].
Managing NUCA systems e.g., [15, 59]	*(i)* Distinguishing pools of similar data; *(ii)* Access intensity; *(iii)* Read-Write or Private-Shared properties	*(i)* Enables using different cache policies for different data pools (similar to [15]); *(ii)* Reduces the need for reactive mechanisms that detect sharing and read-write characteristics to inform cache policies.

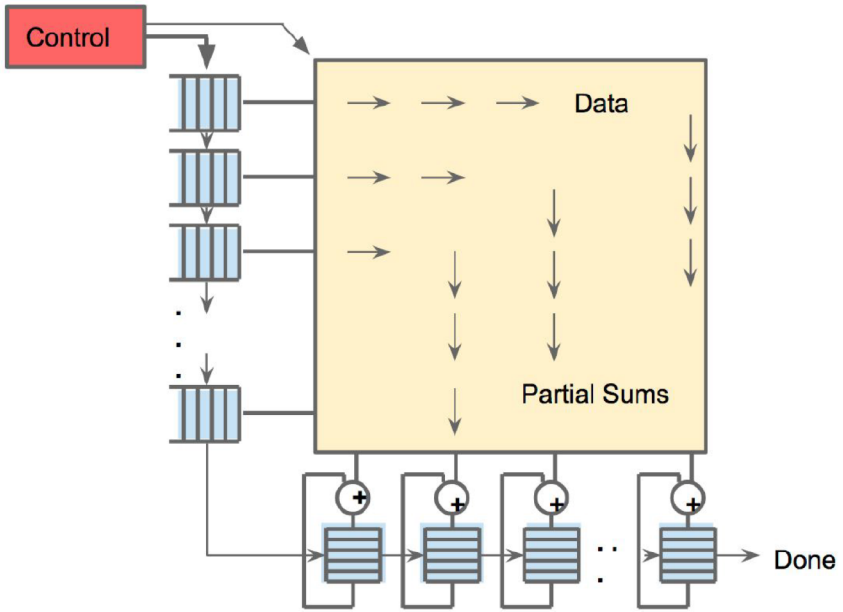
45 TFLOPS per chip
vs 23 TOPS

Designed for training
and inference
vs only inference

An Example Modern Systolic Array: TPU (II)

As reading a large SRAM uses much more power than arithmetic, the matrix unit uses systolic execution to save energy by reducing reads and writes of the Unified Buffer [Kun80][Ram91][Ovt15b]. Figure 4 shows that data flows in from the left, and the weights are loaded from the top. A given 256-element multiply-accumulate operation moves through the matrix as a diagonal wavefront. The weights are preloaded, and take effect with the advancing wave alongside the first data of a new block. Control and data are pipelined to give the illusion that the 256 inputs are read at once, and that they instantly update one location of each of 256 accumulators. From a correctness perspective, software is unaware of the systolic nature of the matrix unit, but for performance, it does worry about the latency of the unit.



Jouppi et al., "In-Datacenter Performance Analysis of a Tensor Processing Unit", ISCA 2017.

An Example Modern Systolic Array: TPU (III)

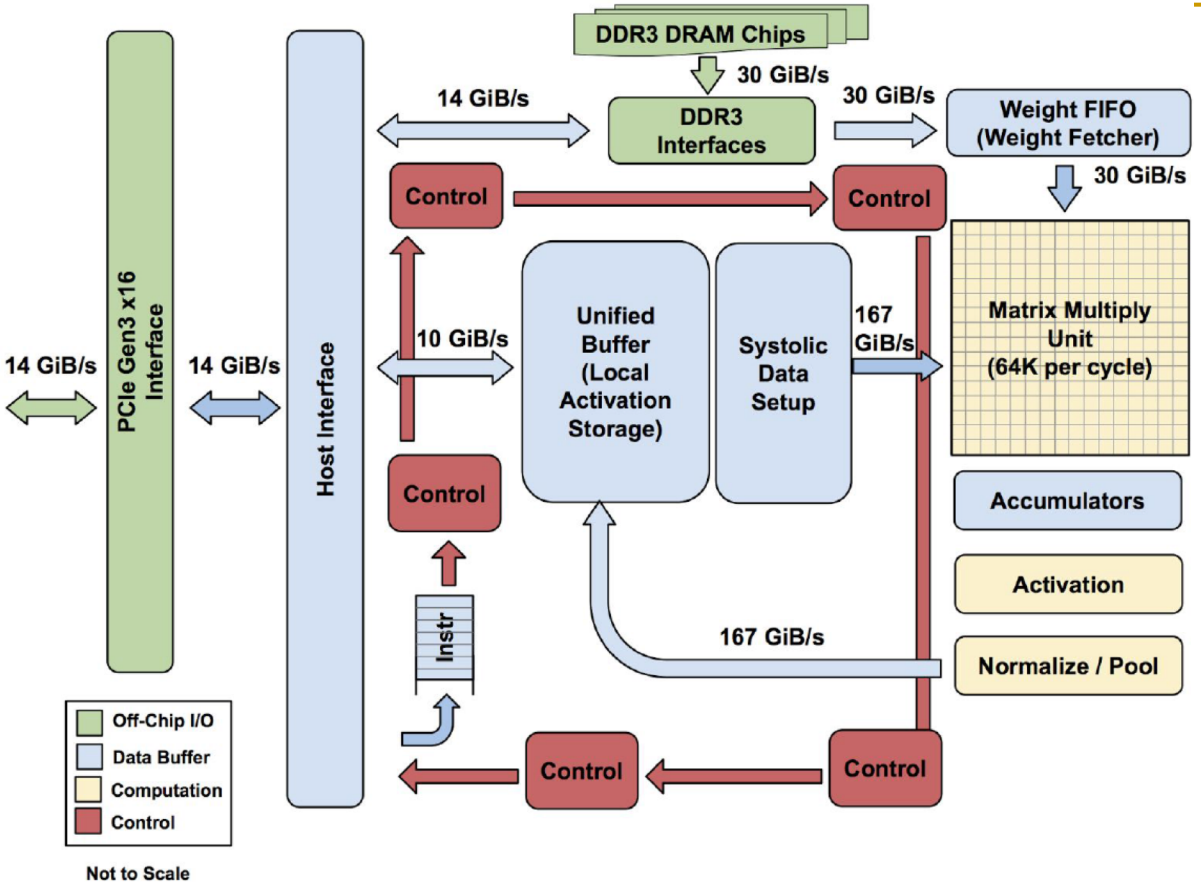


Figure 1. TPU Block Diagram. The main computation part is the yellow Matrix Multiply unit in the upper right hand corner. Its inputs are the blue Weight FIFO and the blue Unified Buffer (UB) and its output is the blue Accumulators (Acc). The yellow Activation Unit performs the nonlinear functions on the Acc, which go to the UB.

Security: Meltdown and Spectre (2018)

Source: J. Masters, Redhat, FOSDEM 2018 keynote talk.

Meltdown and Spectre

- Someone can steal secret data from the system even though
  - your program and data are perfectly correct and
  - your hardware behaves according to the specification and
  - there are no software vulnerabilities/bugs

- Why?
  - Speculative execution leaves traces of secret data in the processor's cache (internal storage)
    - It brings data that is not supposed to be brought/accessed if there was no speculative execution
  - A malicious program can inspect the contents of the cache to "infer" secret data that it is not supposed to access
  - A malicious program can actually force another program to speculatively execute code that leaves traces of secret data

Reading privileged memory with a side-channel

Posted by Jann Horn, Project Zero

We have discovered that CPU data cache timing can be abused to efficiently leak information out of mis-speculated execution, leading to (at worst) arbitrary virtual memory read vulnerabilities across local security boundaries in various contexts.

Oxford Nanopore MinION

Data → performance & energy bottleneck

Why Do We Care? An Example

200 Oxford Nanopore sequencers have left UK for China, to support rapid, near-sample coronavirus sequencing for outbreak surveillance

Fri 31st January 2020

Following extensive support of, and collaboration with, public health professionals in China, Oxford Nanopore has shipped an additional 200 MinION sequencers and related consumables to China. These will be used to support the ongoing surveillance of the current coronavirus outbreak, adding to a large number of the devices already installed in the country.

Each MinION sequencer is approximately the size of a stapler, and can provide rapid sequence information about the coronavirus.

700Kg of Oxford Nanopore sequencers and consumables are on their way for use by Chinese scientists in understanding the current coronavirus outbreak.

Many Interesting Things Are Happening Today in Computer Architecture

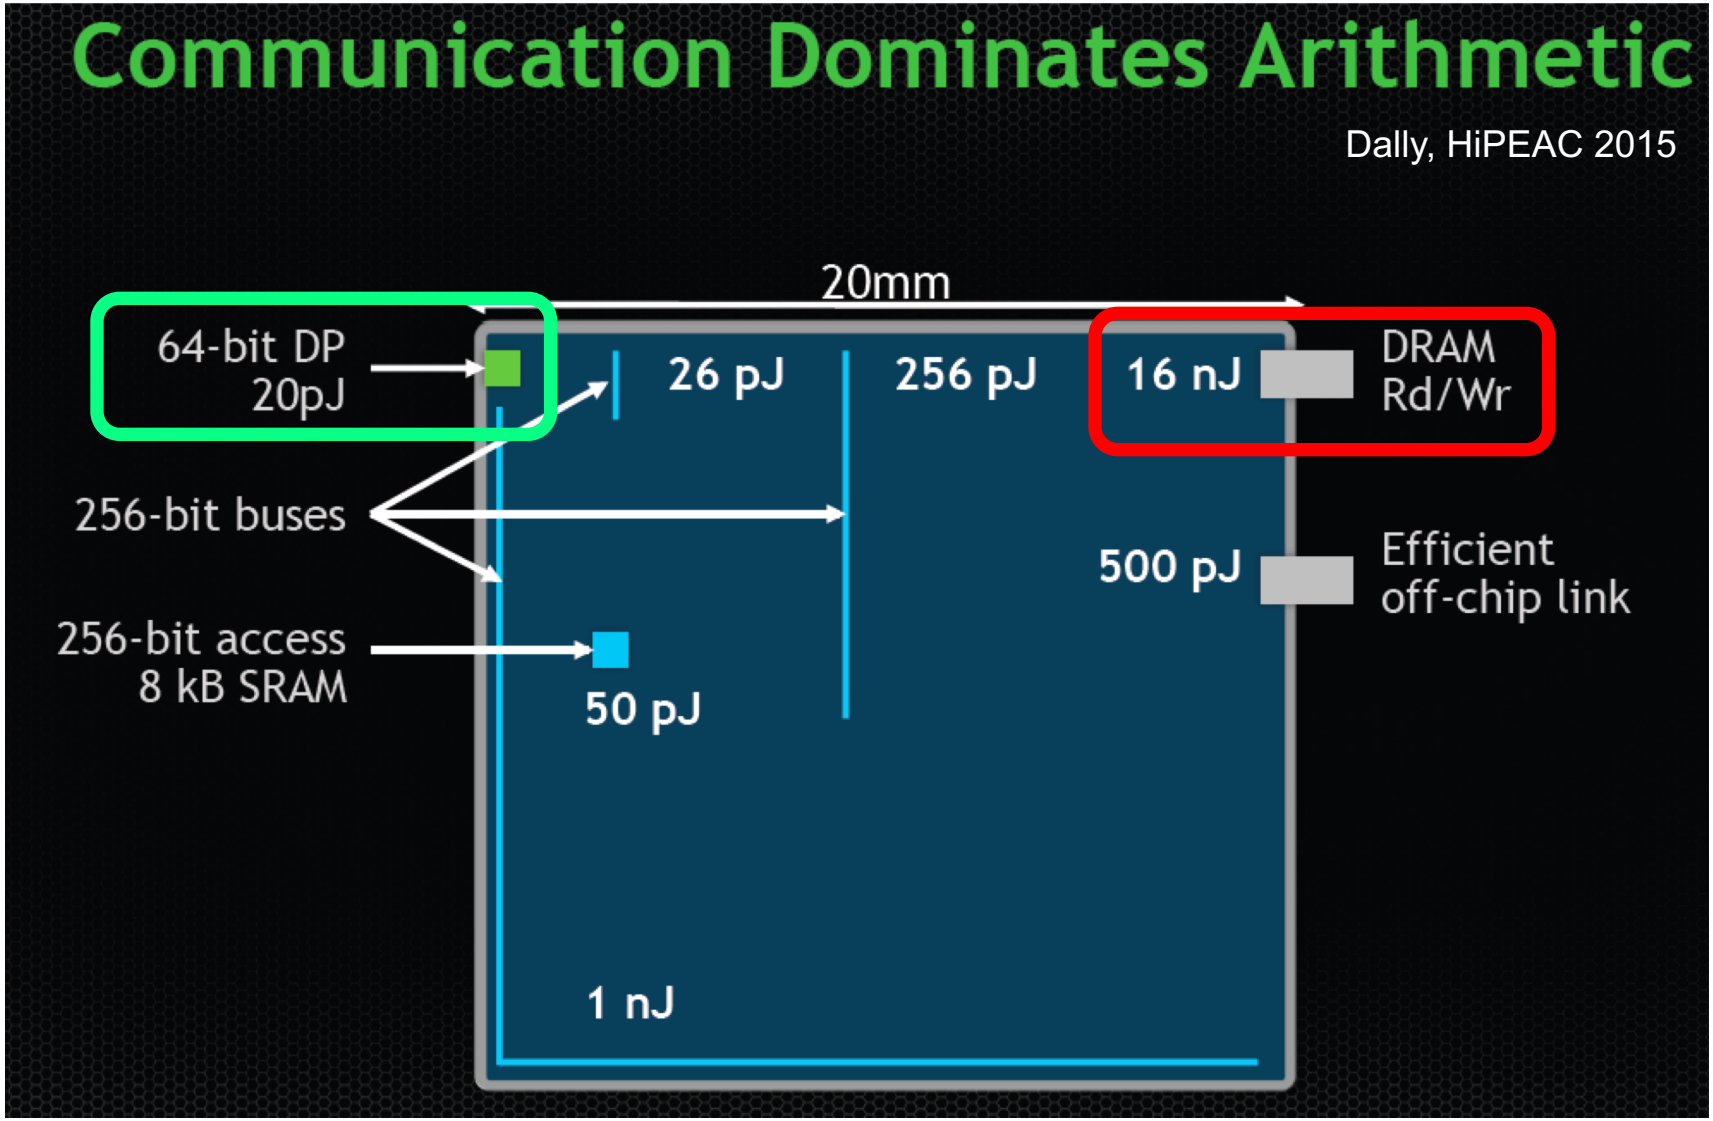
Many Novel Concepts Investigated Today

- New Computing Paradigms (Rethinking the Full Stack)
  - Processing in Memory, Processing Near Data
  - Neuromorphic Computing
  - Fundamentally Secure and Dependable Computers
- New Accelerators (Algorithm-Hardware Co-Designs)
  - Artificial Intelligence & Machine Learning
  - Graph Analytics
  - Genome Analysis
- New Memories and Storage Systems
  - Non-Volatile Main Memory
  - Intelligent Memory

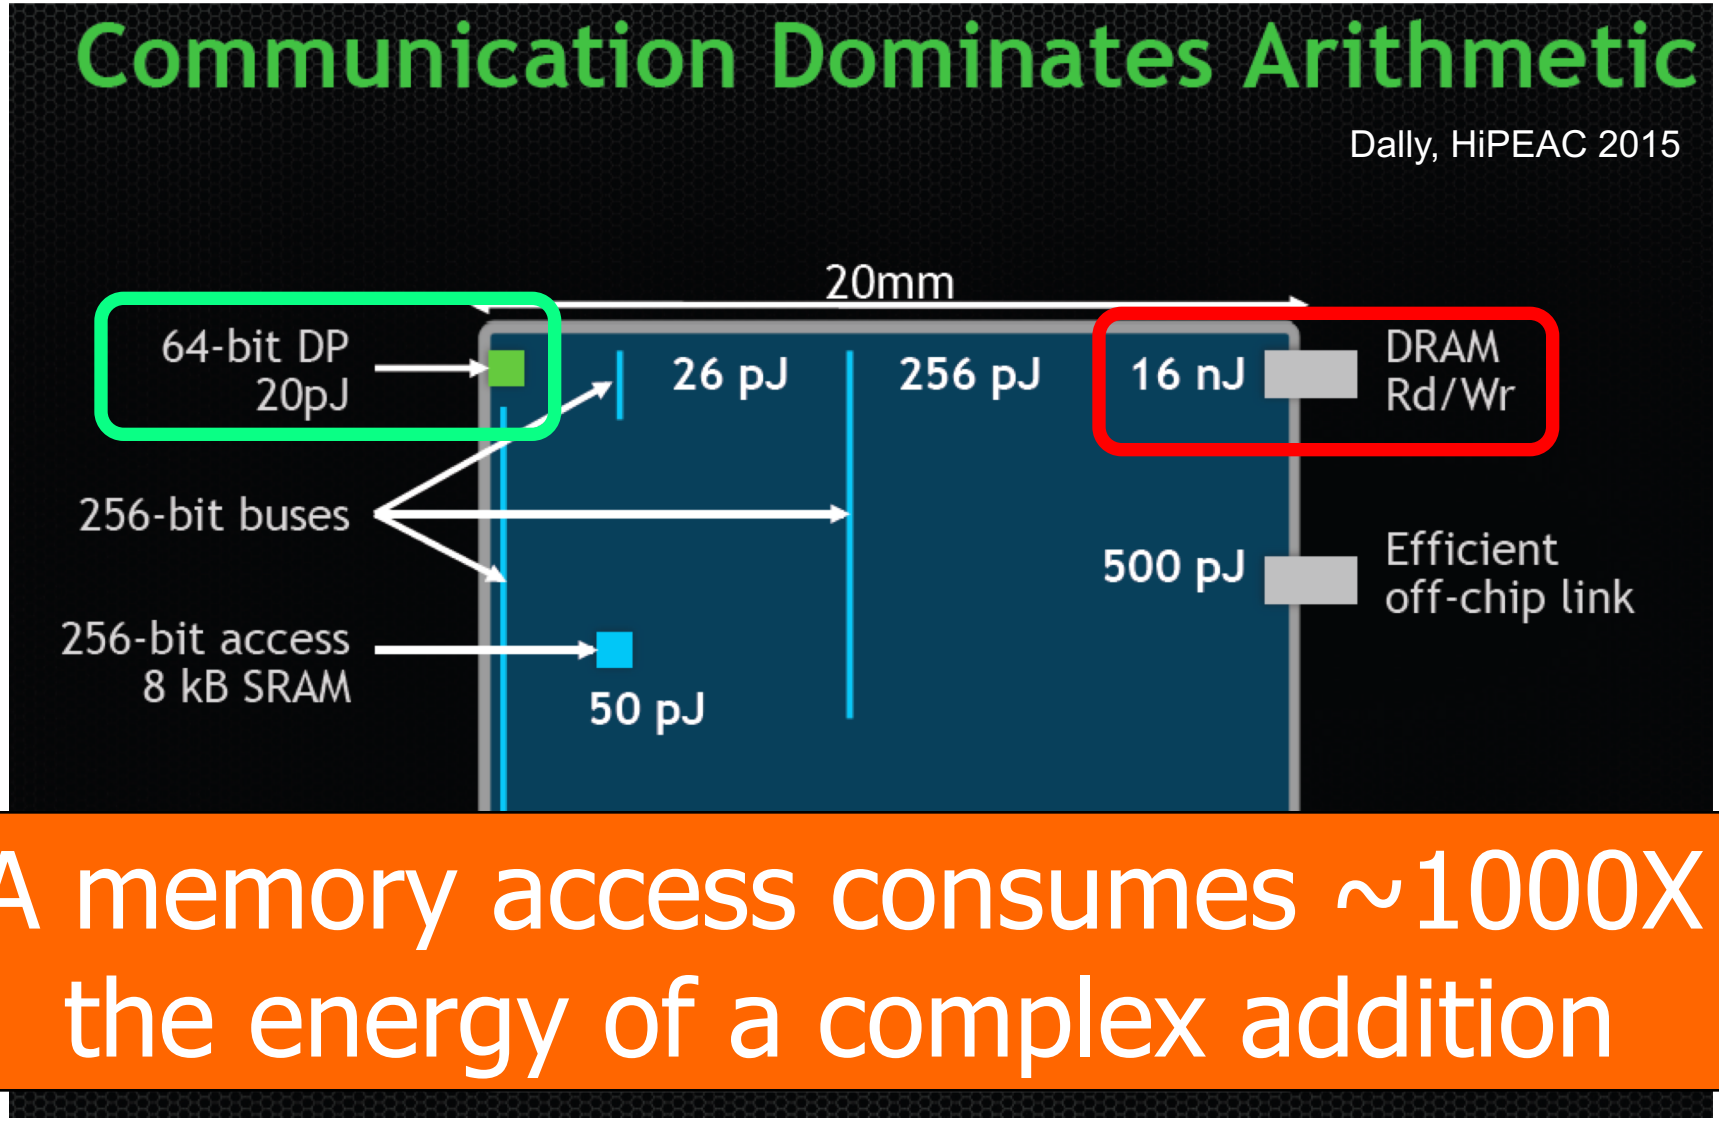
Increasingly Demanding Applications

- Dream, and they will come

Increasingly Diverging/Complex Tradeoffs



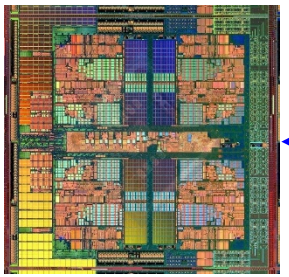
Increasingly Diverging/Complex Tradeoffs



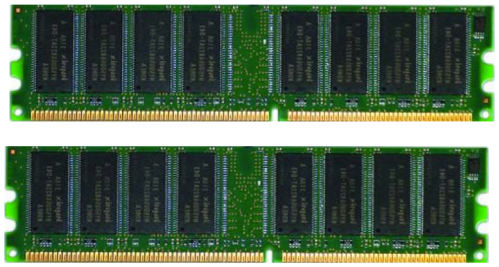
A memory access consumes ~1000X the energy of a complex addition

Increasingly Complex Systems

Past systems



Microprocessor

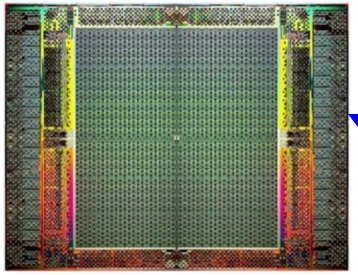


Main Memory

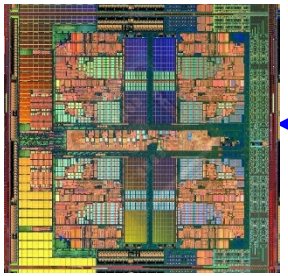
Storage (SSD/HDD)

Increasingly Complex Systems

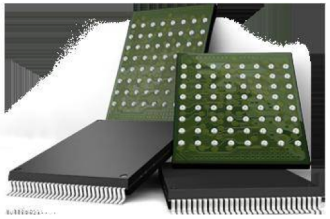
FPGAs



Modern systems

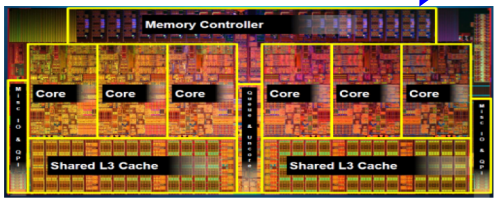


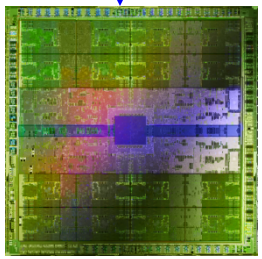
Hybrid Main Memory



Persistent Memory/Storage

Heterogeneous Processors and Accelerators

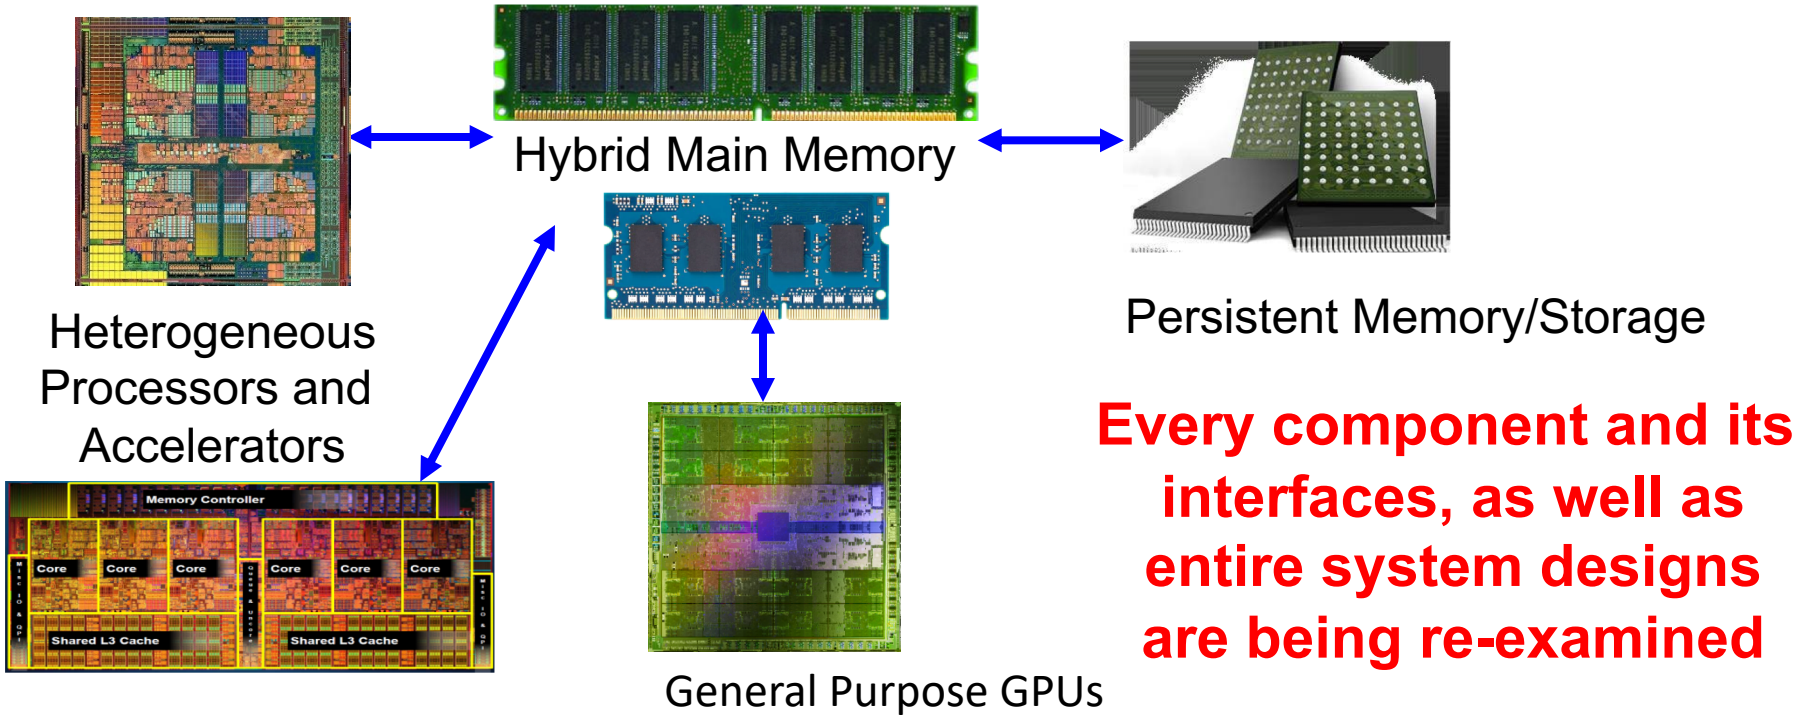




(General Purpose) GPUs

Computer Architecture Today

- Computing landscape is very different from 10-20 years ago
- Applications and technology both demand novel architectures



Every component and its interfaces, as well as entire system designs are being re-examined

Computer Architecture Today (II)

- You can revolutionize the way computers are built, if you understand both the hardware and the software (and change each accordingly)

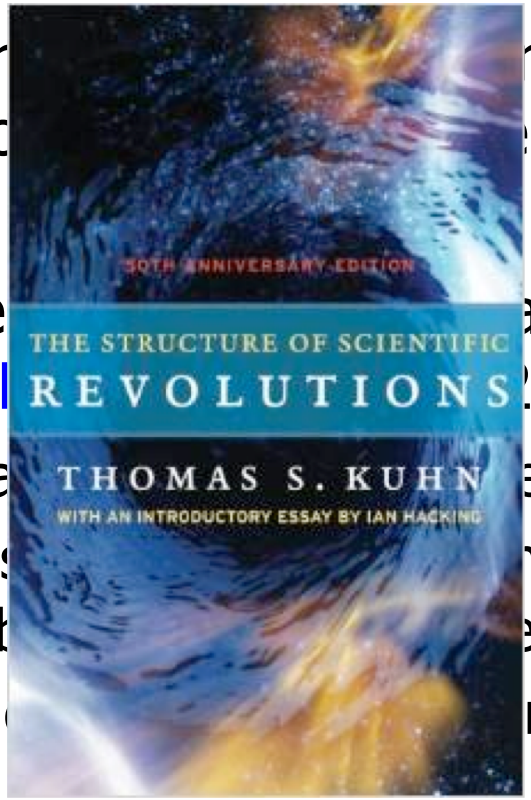
- You can invent new paradigms for computation, communication, and storage

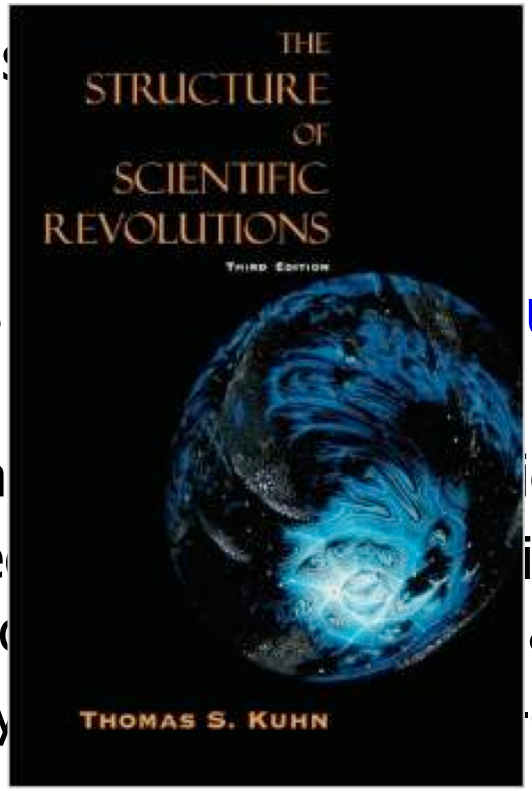
- Recommended book: Thomas Kuhn, "The Structure of Scientific Revolutions" (1962)
  - Pre-paradigm science: no clear consensus in the field
  - Normal science: dominant theory used to explain/improve things (business as usual); exceptions considered anomalies
  - Revolutionary science: underlying assumptions re-examined

Computer Architecture Today (II)

- You can revolutionize the way computers are built, if you understand both the hardware and the software (and change each accordingly)

- You can ir ms communic e
- Recomme as ure of Scientific I .)
  - Pre-para ea ield
  - Normal s he improve things (b ex anomalies
  - Revoluti rly examined





Takeaways

- It is an exciting time to be understanding and designing computing architectures
- Many challenging and exciting problems in platform design
  - That no one has tackled (or thought about) before
  - That can have huge impact on the world's future
- Driven by huge hunger for data (Big Data), new applications (ML/AI, graph analytics, genomics), ever-greater realism, ...
  - We can easily collect more data than we can analyze/understand
- Driven by significant difficulties in keeping up with that hunger at the technology layer
  - Five walls: Energy, reliability, complexity, security, scalability

The Role of This Course

Seminar in Comp Arch

- We will cover **fundamental** and **cutting-edge** research papers in computer architecture

- Multiple components that are aimed at improving students'
  - technical skills in computer architecture
  - critical thinking and analysis
  - technical presentation of concepts and papers
    - in both spoken and written forms
  - familiarity with key research directions

Key Goal

(Learn how to)

rigorously

analyze, present, discuss

papers and ideas

in computer architecture

Steps to Achieve the Key Goal

- Steps for the Presenter
  - Read
  - Absorb, read more (other related works)
  - Critically analyze; think; synthesize
  - Prepare a clear and rigorous talk
  - Present
  - Answer questions
  - Analyze and synthesize (in meeting, after, and at course end)

- Steps for the Participants
  - Discuss
  - Ask questions
  - Analyze and synthesize (in meeting, after, and at course end)

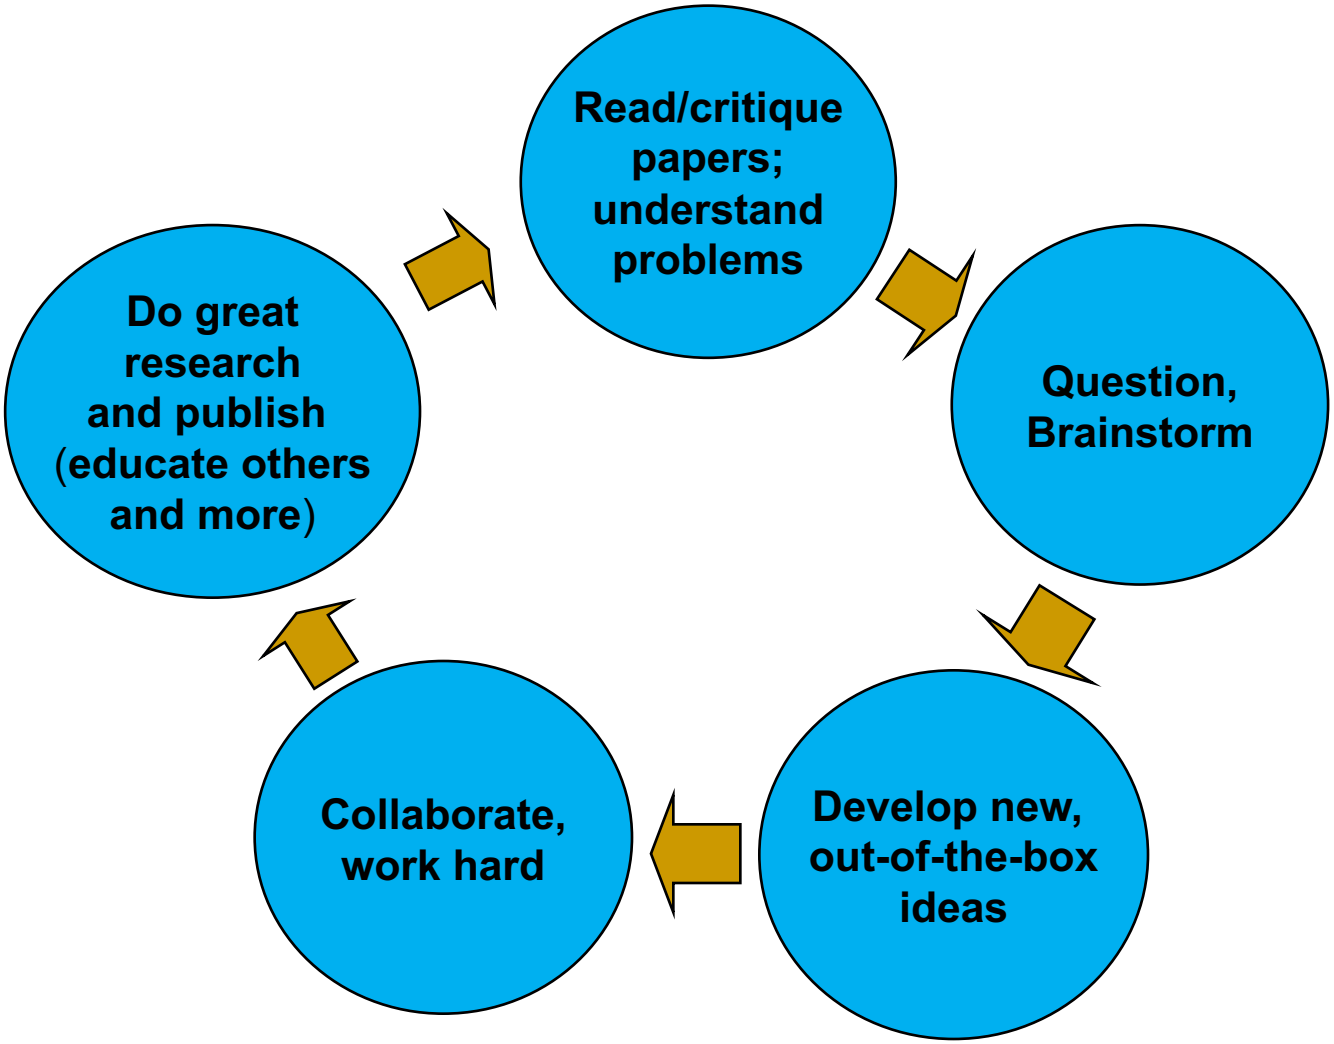
Topics of Papers and Discussion

- hardware security;
- architectural acceleration mechanisms for key applications like machine learning, graph processing and bioinformatics;
- memory systems;
- interconnects;
- processing inside memory;
- various fundamental and emerging ideas/paradigms in computer architecture;
- hardware/software co-design and cooperation;
- fault tolerance;
- energy efficiency;
- heterogeneous and parallel systems;
- new execution models, etc.

Recap: Some Goals of This Course

- Teach/enable/empower you to:
  - Think critically
  - Think broadly
  - Learn how to understand, analyze and present papers and ideas
  - Get familiar with key first steps in research
  - Get familiar with key research directions

The Virtuous Cycle of Scientific Progress



Course Info and Logistics

Course Info: Who Are We?

- **Onur Mutlu**
  - Full Professor @ ETH Zurich ITET (INFK), since September 2015
  - Strecker Professor @ Carnegie Mellon University ECE/CS, 2009-2016, 2016-…
  - PhD from UT-Austin, worked at Google, VMware, Microsoft Research, Intel, AMD
  - https://people.inf.ethz.ch/omutlu/
  - omutlu@gmail.com (Best way to reach me)
  - https://people.inf.ethz.ch/omutlu/projects.htm
- Research and Teaching in:
  - Computer architecture, computer systems, hardware security, bioinformatics
  - Memory and storage systems
  - Hardware security, safety, predictability
  - Fault tolerance
  - Hardware/software cooperation
  - Architectures for bioinformatics, health, medicine
  - …

Course Info: Who Are We?

- Instructors:
  - Dr. Mohammed Alser
  - Dr. Juan Gomez Luna
- Teaching Assistants
  - Dr. Jisung Park,
  - Dr. Jawad Haj-Yahya,
  - Dr. Lois Orosa,
  - Haiyu Mao
  - Rahul Bera,
  - João Dinis Ferreira,
  - Geraldo Francisco,
  - Can Firtina,
  - Hasan Hassan,
  - Konstantinos Kanellopoulos,
  - Jeremie Kim,
  - Nika Mansouri
  - Minesh Patel,
  - Gagandeep Singh,
  - Kosta Stojiljkovic,
  - Giray Yaglikci
- Get to know them and their research
- They will be your mentors – you will have to meet them at least twice before your presentations

Course Requirements and Expectations

- Attendance required for all meetings
- Each student presents one paper
  - Prepare for presentation with engagement from the mentor
  - Full presentation + questions + discussion
- Non-presenters participate during the meeting
  - Ask questions, contribute thoughts/ideas
  - Better if you read/skim the paper beforehand
- Non-presenters take an online short quiz after each session
  - 5 MCQs for each presentation (2 hours to submit)
- Everyone comments on papers in the online review system
  - After presentation
- Write synthesis report at the end of semester
  - (sample synthesis report online)

Course Website

- https://safari.ethz.ch/architecture_seminar/fall2020
- All course materials to be posted
- Plus other useful information for the course
- Check frequently for announcements and due dates

Homework 0

- Due September 24
  - https://safari.ethz.ch/architecture_seminar/fall2020
- Information about yourself
- All future grading is predicated on homework 0
- If it is not submitted on time, we cannot schedule you for a presentation.

Paper Review Preferences

- Due September 24
- Check the website for instructions
- If it is not submitted on time, we cannot schedule you for a presentation.

How to Deliver a Good Talk

Anatomy of a Good Paper Review (Talk)

- 0: Title, Authors, Venue
- 1: Summary
  - What is the problem the paper is trying to solve?
  - What are the key ideas of the paper? Key insights?
  - What are the key mechanisms? What is the implementation?
  - What are the key results? Key conclusions?
- 2: Strengths (most important ones)
  - Does the paper solve the problem well? Is it well written? …
- 3: Weaknesses (most important ones)
  - This is where you should think critically. Every paper/idea has a weakness. This does not mean the paper is necessarily bad. It means there is room for improvement and future research can accomplish this.
- 4: Thoughts/Ideas: Can you do better? Present your ideas.
- 5: Takeaways: What you learned/enjoyed/disliked? Why?
- 6: Discussion starters and questions.
- Review should be short and concise (20 minutes or < one page)

Suggested Paper Discussion Format

- Problem & Goal
- Key Ideas/solution
- Novelty
- Mechanisms & Implementation
- Major Results
- Takeaways/Conclusions

~20-25 minute Summary

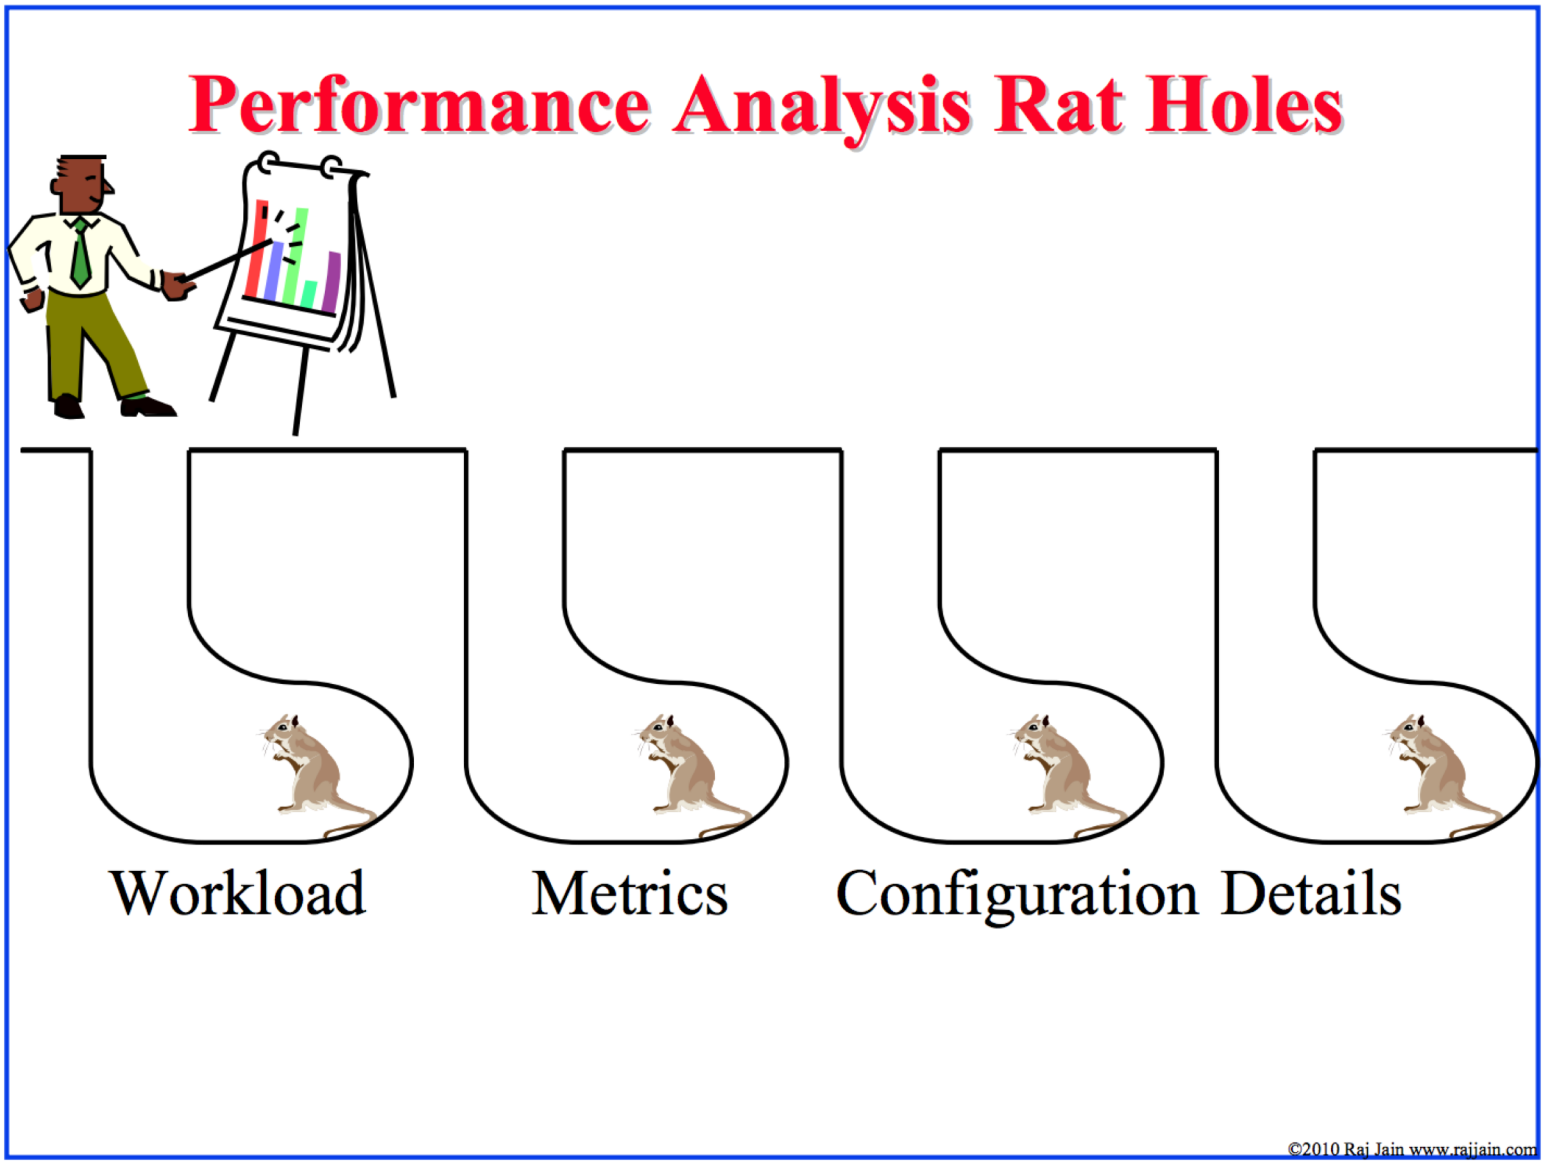
- Strengths
- Weaknesses
- Alternatives
- New ideas/problems
- Brainstorming and Discussion

~10 min Critique plus ~15 min Discussion

More Advice on Paper Review Talk

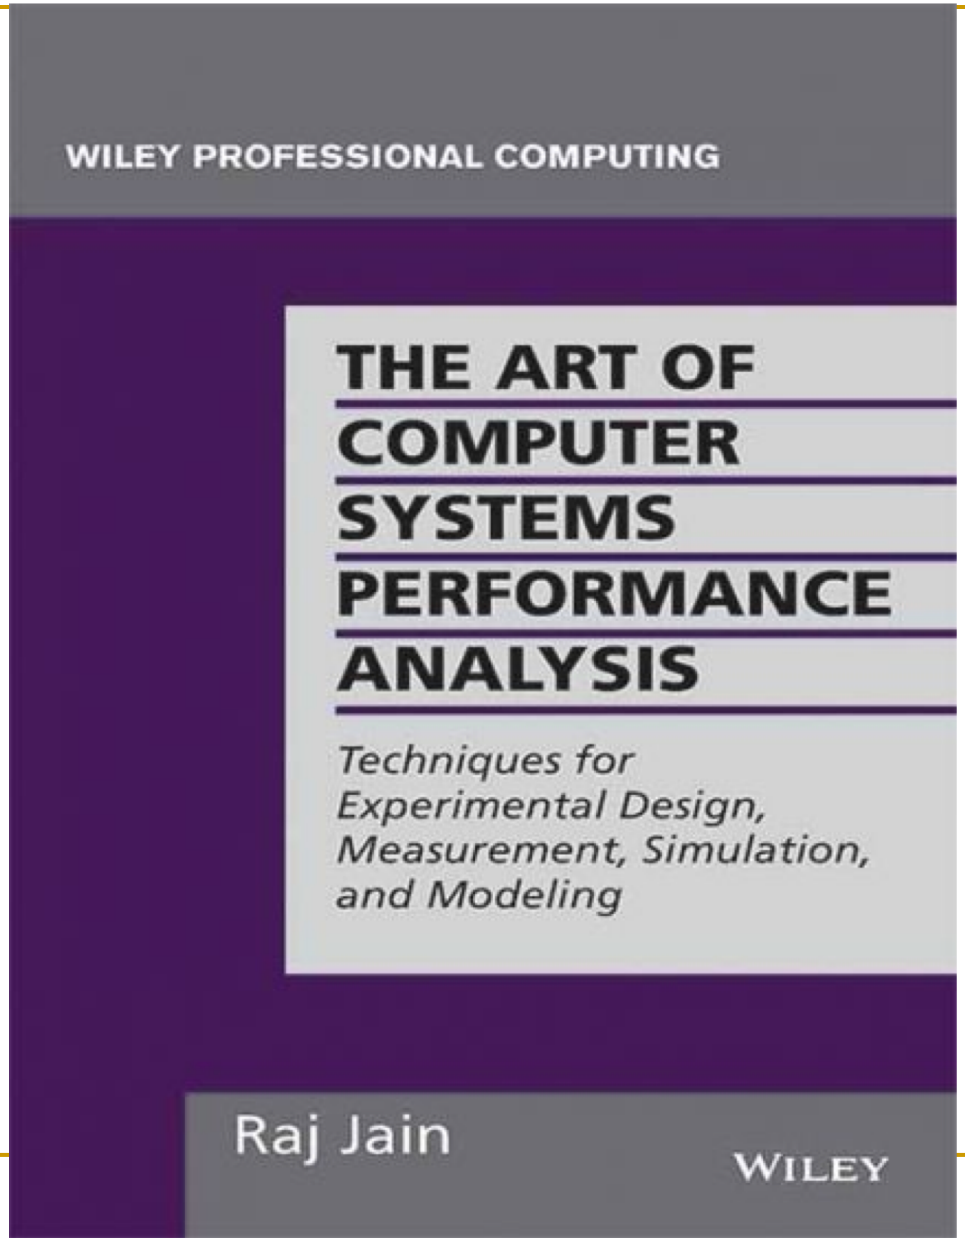
- When doing the paper reviews and analyses, be very critical
- Always think about better ways of solving the problem or related problems
  - Question the problem as well
  - Read background papers (both past and future)
- This is how things progress in science and engineering (or anywhere), and how you can make big leaps
  - By critical analysis
- A few sample text reviews provided online

Try to Avoid Rat Hole Discussions



Source: https://www.cse.wustl.edu/~jain/iucee/ftp/k_10adp.pdf

Aside: A Recommended Book



Raj Jain, "The Art of Computer Systems Performance Analysis," Wiley, 1991.

10.8 DECISION MAKER'S GAMES

Even if the performance analysis is correctly done and presented, it may not be enough to persuade your audience—the decision makers—to follow your recommendations. The list shown in Box 10.2 is a compilation of reasons for rejection heard at various performance analysis presentations. You can use the list by presenting it immediately and pointing out that the reason for rejection is not new and that the analysis deserves more consideration. Also, the list is helpful in getting the competing proposals rejected!

There is no clear end of an analysis. Any analysis can be rejected simply on the grounds that the problem needs more analysis. This is the first reason listed in Box 10.2. The second most common reason for rejection of an analysis and for endless debate is the workload. Since workloads are always based on the past measurements, their applicability to the current or future environment can always be questioned. Actually workload is one of the four areas of discussion that lead a performance presentation into an endless debate. These "rat holes" and their relative sizes in terms of time consumed are shown in Figure 10.26. Presenting this cartoon at the beginning of a presentation helps to avoid these areas.

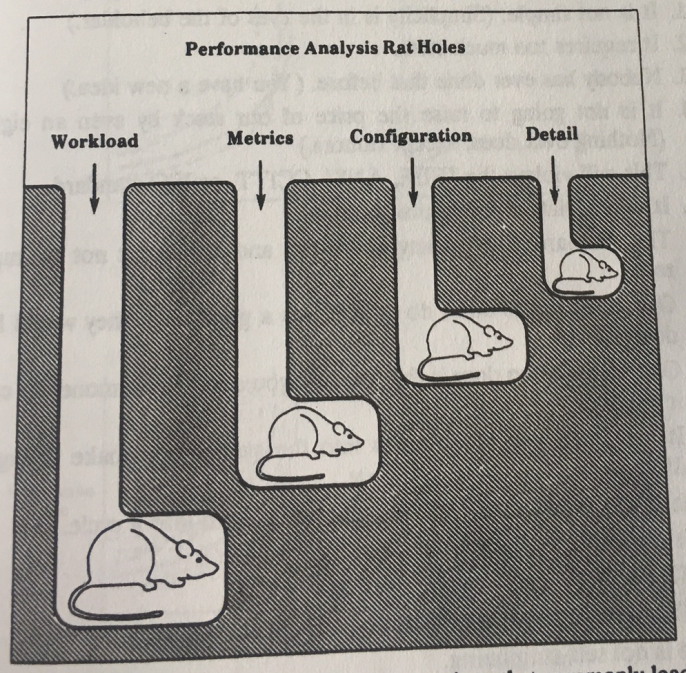


FIGURE 10.26 Four issues in performance presentations that commonly lead to endless discussion.

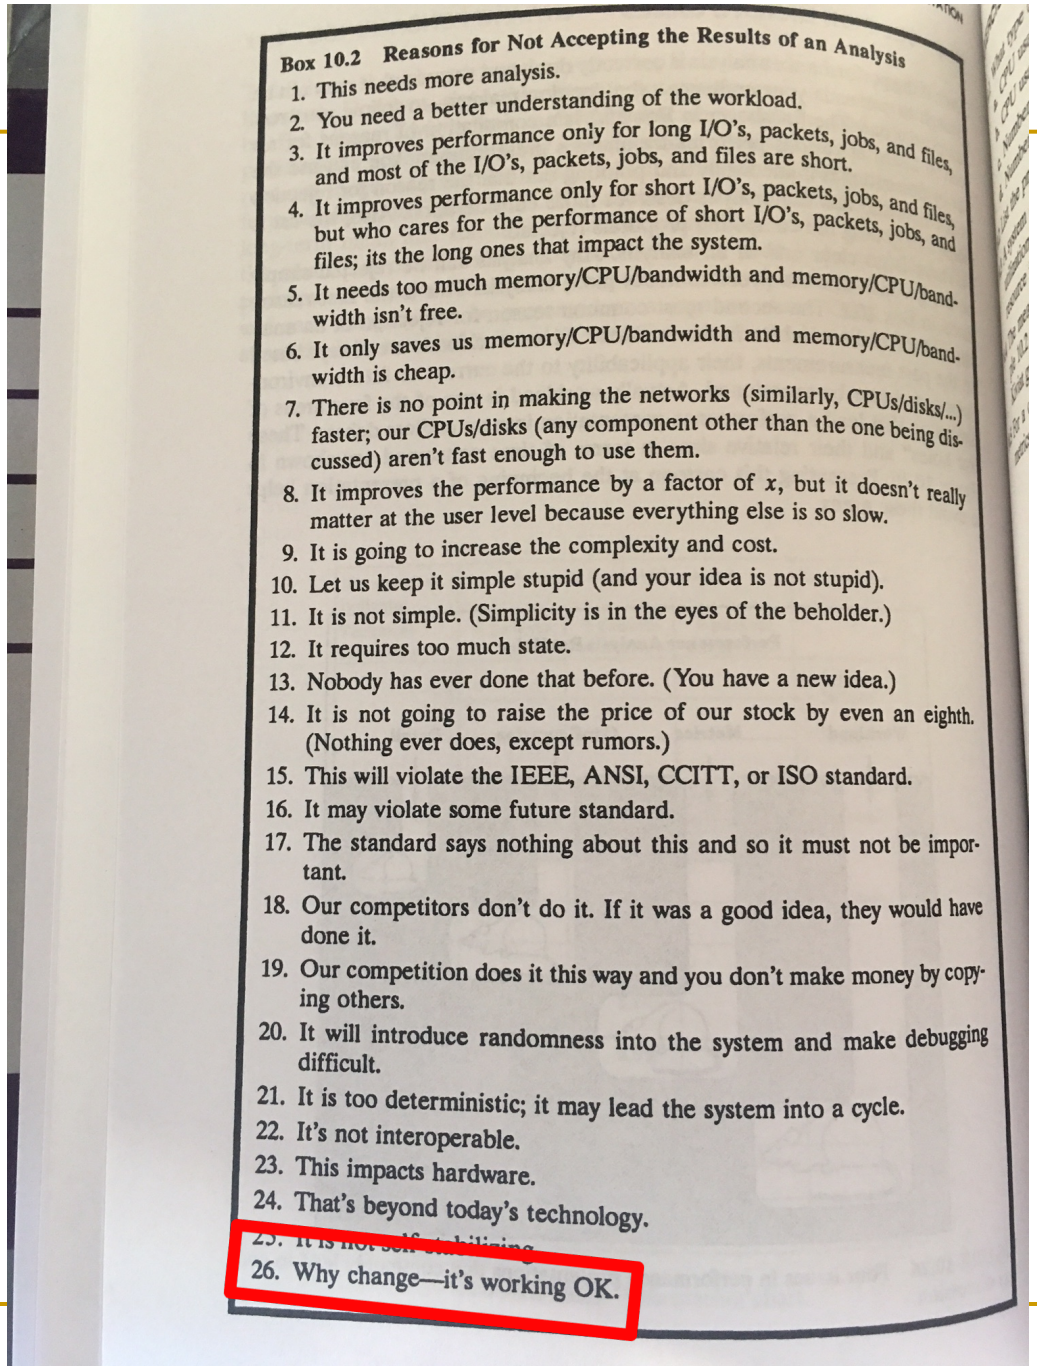
Raj Jain, "The Art of Computer Systems Performance Analysis," Wiley, 1991.



Box 10.2 Reasons for Not Accepting the Results of an Analysis

1. This needs more analysis.
2. You need a better understanding of the workload.
3. It improves performance only for long I/O's, packets, jobs, and files, and most of the I/O's, packets, jobs, and files are short.
4. It improves performance only for short I/O's, packets, jobs, and files, but who cares for the performance of short I/O's, packets, jobs, and files; its the long ones that impact the system.
5. It needs too much memory/CPU/bandwidth and memory/CPU/bandwidth isn't free.
6. It only saves us memory/CPU/bandwidth and memory/CPU/bandwidth is cheap.
7. There is no point in making the networks (similarly, CPUs/disks/...) faster; our CPUs/disks (any component other than the one being discussed) aren't fast enough to use them.
8. It improves the performance by a factor of x, but it doesn't really matter at the user level because everything else is so slow.
9. It is going to increase the complexity and cost.
10. Let us keep it simple stupid (and your idea is not stupid).
11. It is not simple. (Simplicity is in the eyes of the beholder.)
12. It requires too much state.
13. Nobody has ever done that before. (You have a new idea.)
14. It is not going to raise the price of our stock by even an eighth. (Nothing ever does, except rumors.)
15. This will violate the IEEE, ANSI, CCITT, or ISO standard.
16. It may violate some future standard.
17. The standard says nothing about this and so it must not be important.
18. Our competitors don't do it. If it was a good idea, they would have done it.
19. Our competition does it this way and you don't make money by copying others.
20. It will introduce randomness into the system and make debugging difficult.
21. It is too deterministic; it may lead the system into a cycle.
22. It's not interoperable.
23. This impacts hardware.
24. That's beyond today's technology.
25. It is not self-stabilizing.
26. Why change—it's working OK.

Raj Jain, "The Art of Computer Systems Performance Analysis," Wiley, 1991.

More Advice on Talks

- Kayvon Fatahalian, "Tips for Giving Clear Talks"
  - http://graphics.stanford.edu/~kayvonf/misc/cleartalktips.pdf
  - Many useful and simple principles here

"Every sentence matters"

"The audience prefers not to think" (about things you can just tell them)

"Surprises are bad": say why before what
(indicate why you are saying something before you say it)

Explain every figure, graph, or equation

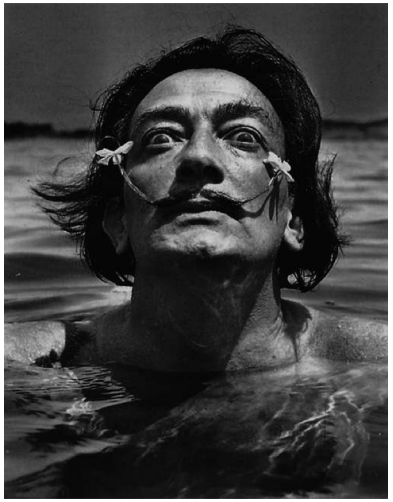
When improving the talk, the audience is always right

Who Painted This Painting?

Salvador Dali @ 1924

Source: http://www.museoreinasofia.es/en/collection/artwork/retrato-luis-bunuel-portrait-luis-bunuel http://salvadordaliprints.org/biography/

What About This?



Salvador Dali @ 1937

Source: http://salvadordaliprints.org/the-burning-giraffe/ https://www.dalipaintings.com/

Takeaway

Learn the basic principles

before you

consciously choose to break them

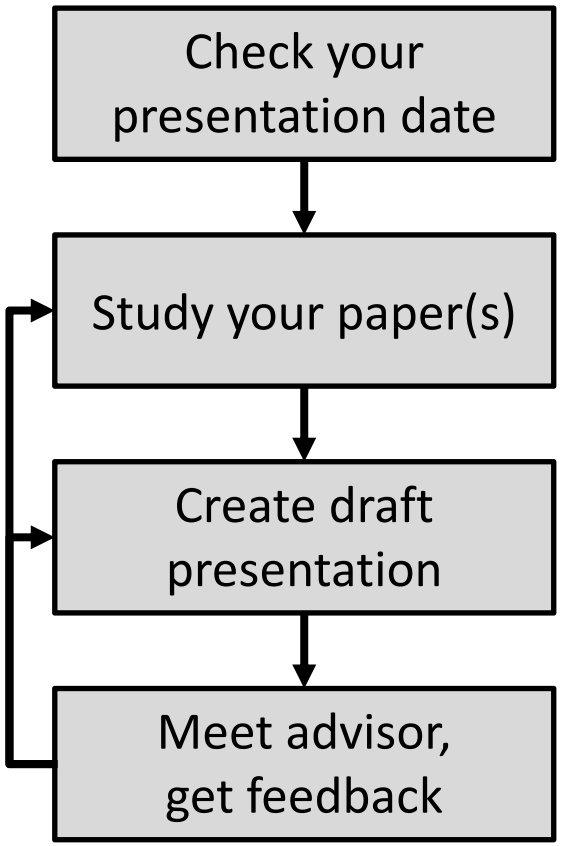
How to Participate

How to Make the Best Out of This?

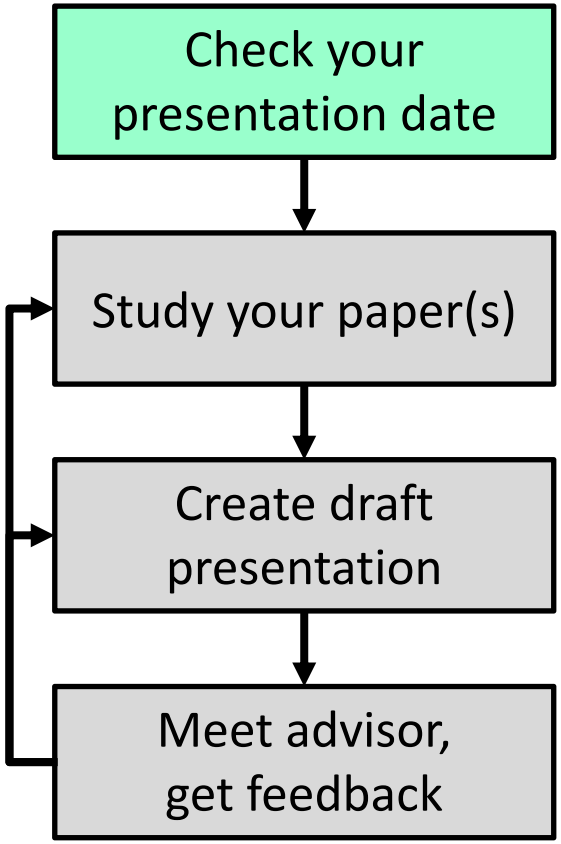
- Come prepared → Read and critically evaluate the paper
- Think new ideas
- Bring discussion points and questions; read other papers
- Be critical
- Brainstorm – be open to new ideas
- Pay attention and discuss+contribute
- Participate online before and after each meeting

Guided Talk Preparation

Preparing a Talk

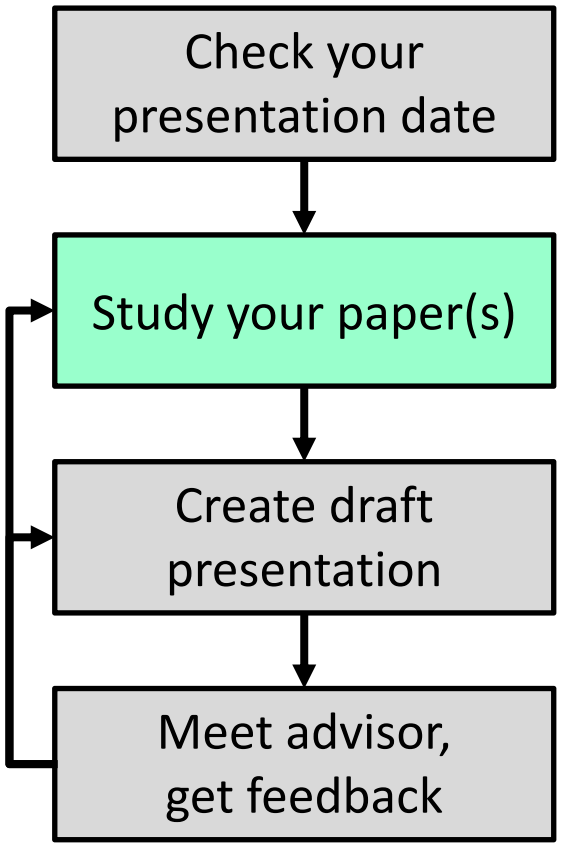


Preparing a Talk: Start Early



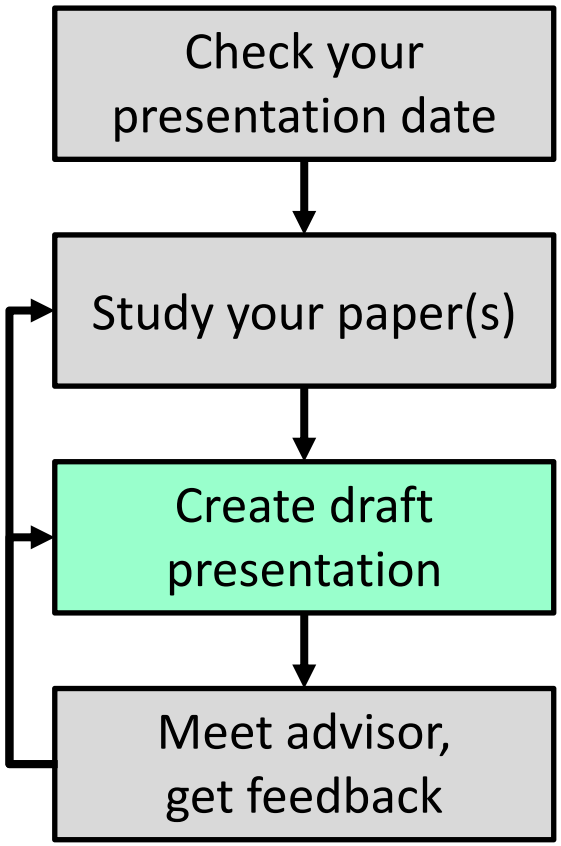
- Preparing a good presentation takes time
- Start early!

Preparing a Talk: Study Paper



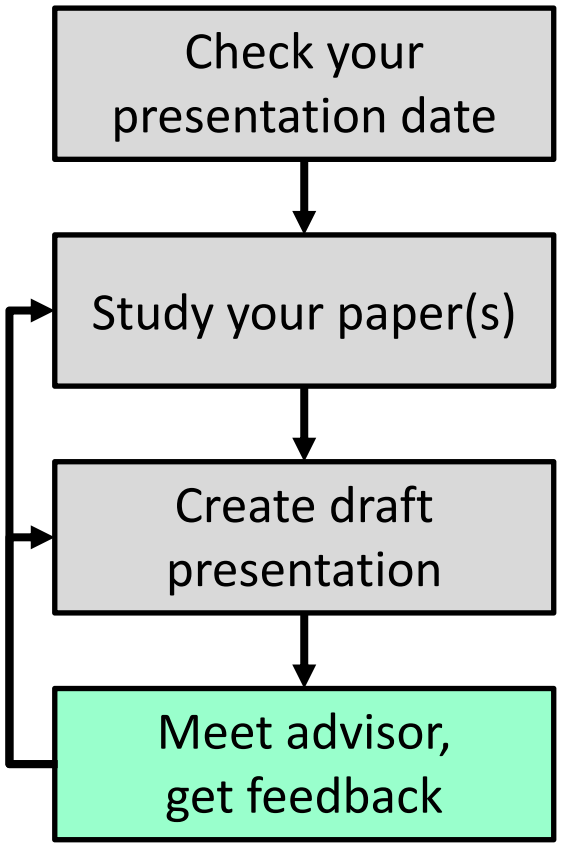
- 3 'C's of reading
  - *Carefully:* look up terms, possibly read cited papers
  - *Critically:* find limitations, flaws
  - *Creatively:* think of improvements
- Try examples by hand
- Try tools if available
- Consult with TA if questions

Preparing a Talk: Create Draft



- Explain the motivation for the work
- Clearly present the technical solution and results
  - Include a demo if appropriate
- Outline limitations or improvements
- Focus on the key concepts
  - Do not present all of the details

Preparing a Talk: Get Feedback



- Prepare for the meeting
  - Schedule early
  - Send slides in advance
  - Write down questions
- Make sure you address feedback
  - Take notes
- Meetings are mandatory!
  - At least one week before the talk
  - Two meetings

Grading and Feedback

Grading Rubric

- Quality of your presentation (60%)
  - How well did you understand the material?
  - How well did you present it?
  - How well did you answer the questions?
  - Be prepared to explain technical terms
  - We will take into account the difficulty of the paper and the time you had to prepare.
- Quality of the final synthesis paper (30%)
  - How well did you understand some of the papers presented during the seminar?
- Attendance & Quizzes (10%)
- Participation (during class and online) (BONUS 10%)
  - Did you ask good questions?
  - Did you attend all sessions?

Feedback

- We will try to (briefly) discuss strengths/weaknesses of your talk in class
  - Let us know upfront if you would prefer **not** to
- You can arrange a meeting with your TA to get feedback

Expected Schedule

Schedule

- We will meet once a week, with two presentations per session
  - *Next meeting next week*
  - *Your presentations start on 8 October*
  - 22 presentations in total
  - Each presentation 50 minutes including questions and discussion

- Paper assignment
  - Will be done online
  - Study the list of papers
  - Check your email and be responsive

Homework 0

- Due September 24
  - https://safari.ethz.ch/architecture_seminar/fall2020
- Information about yourself
- All future grading is predicated on homework 0
- If it is not submitted on time, we cannot schedule you for a presentation.

Paper Review Preferences

- Due September 24
- Check the website for instructions
- If it is not submitted on time, we cannot schedule you for a presentation.

Seminar in Computer Architecture

Meeting 1: Introduction

Prof. Onur Mutlu

ETH Zürich

Fall 2020

17 September 2020
