The Problem

Computing is Bottlenecked by Data
Data is Key for AI, ML, Genomics, …

- Important workloads are all data intensive

- They require rapid and efficient processing of large amounts of data

- Data is increasing
  - We can generate more than we can process
Data is Key for Future Workloads

Computer Architecture Today

- Computing landscape is very different from 10-20 years ago
- Applications and technology both demand novel architectures

Every component and its interfaces, as well as entire system designs are being re-examined
You can revolutionize the way computers are built, if you understand both the hardware and the software (and change each accordingly)

You can invent new paradigms for computation, communication, and storage

Recommended book: Thomas Kuhn, “The Structure of Scientific Revolutions” (1962)

- Pre-paradigm science: no clear consensus in the field
- Normal science: dominant theory used to explain/improve things (business as usual); exceptions considered anomalies
- Revolutionary science: underlying assumptions re-examined
You can revolutionize the way computers are built, if you understand both the hardware and the software (and change each accordingly).

You can invent new paradigms for computation, communication, and storage.

- Pre-paradigm science: no clear consensus in the field
- Normal science: dominant theory used to explain/improve things (business as usual); exceptions considered anomalies
- Revolutionary science: underlying assumptions re-examined
Takeaways

- It is an exciting time to be understanding and designing computing architectures

- Many **challenging and exciting problems**
  - That no one has tackled (or thought about) before
  - That can have huge impact on the world’s future

- Driven by **explosion of data, new applications** (ML/AI, graph analytics, genomics), ever-greater realism, ...
  - We can easily collect more data than we can analyze/understand

- Driven by **significant difficulties** in keeping up with that hunger **at the technology layer**
  - Five walls: Energy, reliability, complexity, security, scalability
Two Major Goals of This Course

- Enable you to **think critically**
- Enable you to **think broadly**
Let’s Start with Some Puzzles

a.k.a. Computer Architecture resembles Building Architecture

What do All Those Have in Common with Bahnhof Stadelhofen?
ETH Alumnus, PhD Civil Engineering

“The train station has several of the features that became signatures of his work; straight lines and right angles are rare.”

Santiago Calatrava Valls (born 28 July 1951) is a Spanish architect, structural engineer, sculptor and painter, particularly known for his bridges supported by single leaning pylons, and his railway stations, stadiums, and museums, whose sculptural forms often resemble living organisms. His best-known works include the Milwaukee Art Museum, the Turning Torso tower in Malmo, Sweden, the Margaret Hunt Hill Bridge in Dallas, Texas, and the Museum of Tomorrow in Rio de Janeiro.

Your First Comp. Architecture Assignment

- Go and find the closest Calatrava building to this classroom
  - For those who like a challenge, find the furthest building that was designed by Calatrava to his classroom 😊

- Appreciate the beauty & out-of-the-box and creative thinking

- Think about tradeoffs in the design
  - Strengths, weaknesses, goals of design

- Derive principles on your own for good design and innovation

- Due date: **Any time during or after this course**
  - Later during the course is better
  - Apply what you have learned in this course
  - Think out-of-the-box
But First, Today’s First Assignment
Find The Differences of This and That
This
That

Many Tradeoffs Between Two Designs

- You can list them after you complete the first assignment...
Aside: Evaluation Criteria for the Designs

- Functionality (Does it meet the specification?)
- Reliability
- Space requirement
- Cost
- Expandability
- Comfort level of users
- Happiness level of users
- Aesthetics
- Security
- ...

How to evaluate goodness of design is always a critical question → “Performance“ evaluation and metrics
A Key Question

How was Calatrava able to design especially his key buildings?

Can have many guesses

- (Very) hard work, perseverance, dedication (over decades)
- Experience
- Creativity, Out-of-the-box thinking
- A good understanding of past designs
- Good judgment and intuition
- Strong skill combination (math, architecture, art, engineering, ...)
- Initiative, entrepreneurialism, funding ($$$)$, luck
- **Strong understanding of and commitment to fundamentals**
- Principled design
- ...

You will be exposed to and hopefully develop/enhance many of these skills in this course
Principled Design

“To me, there are two overriding principles to be found in nature which are most appropriate for building:

- one is the optimal use of material,
- the other the capacity of organisms to change shape, to grow, and to move.”

*Santiago Calatrava*

“Calatrava's constructions are inspired by natural forms like plants, bird wings, and the human body.”

Source: http://www.arcspace.com/exhibitions/unsorted/santiago-calatrava/
Gare do Oriente, Lisbon, Revisited

Source: http://www.arcspace.com/exhibitions/unsorted/santiago-calatrava/
A Principled Design

Zoomorphic architecture

From Wikipedia, the free encyclopedia

Zoomorphic architecture is the practice of using animal forms as the inspirational basis and blueprint for architectural design. "While animal forms have always played a role adding some of the deepest layers of meaning in architecture, it is now becoming evident that a new strand of biomorphism is emerging where the meaning derives not from any specific representation but from a more general allusion to biological processes."[1]

Some well-known examples of Zoomorphic architecture can be found in the TWA Flight Center building in New York City, by Eero Saarinen, or the Milwaukee Art Museum by Santiago Calatrava, both inspired by the form of a bird’s wings.[3]
What Does This Remind You Of?

Design [edit]

Calatrava said that the Oculus resembles a bird being released from a child's hand. The roof was originally designed to mechanically open to increase light and ventilation to the enclosed space. Herbert Muschamp, architecture critic of The New York Times, compared the design to the Bethesda Terrace and Fountain in Central Park, and wrote in 2004:
“Santiago Calatrava’s design for the World Trade Center PATH station should satisfy those who believe that buildings planned for ground zero must aspire to a spiritual dimension. Over the years, many people have discerned a metaphysical element in Mr. Calatrava’s work. I hope New Yorkers will detect its presence, too. With deep appreciation, I congratulate the Port Authority for commissioning Mr. Calatrava, the great Spanish architect and engineer, to design a building with the power to shape the future of New York. It is a pleasure to report, for once, that public officials are not overstating the case when they describe a design as breathtaking.”

Source: https://en.wikipedia.org/wiki/World_Trade_Center_station_(PATH)
Design Constraints and Criticism

However, Calatrava's original soaring spike design was scaled back because of security issues. The New York Times observed in 2005:

“In the name of security, Santiago Calatrava's bird has grown a beak. Its ribs have doubled in number and its wings have lost their interstices of glass.... [T]he main transit hall, between Church and Greenwich Streets, will almost certainly lose some of its delicate quality, while gaining structural expressiveness. It may now evoke a slender stegosaurus more than it does a bird.”[45]
Stegosaurus

From Wikipedia, the free encyclopedia

For the *pachycephalosaurid* of a similar name, see Stegoceras.

**Stegosaurus** (/ˈstɛgəˌsɔːrəs/)[1] is a genus of armored dinosaur. Fossils of this genus date to the Late Jurassic period, where they are found in Kimmeridgian to early Tithonian aged strata, between 155 and 150 million years ago, in the western United States and Portugal. Several

However, Calatrava's original soaring spike design was scaled back because of security issues. The *New York Times* observed in 2005:

“\[
\text{In the name of security, Santiago Calatrava's bird has grown a beak. Its ribs have doubled in number and its wings have lost their interstices of glass.... [T]he main transit hall, between Church and Greenwich Streets, will almost certainly lose some of its delicate quality, while gaining structural expressiveness. It may now evoke a slender *stegosaurus* more than it does a bird.}^{[45]}
\]"

The design was further modified in 2008 to eliminate the opening and closing roof mechanism because of budget and space constraints.\[^{[46]}\]

The Transportation Hub has been dubbed "the world's most expensive transportation hub" for its massive cost for reconstruction—$3.74 billion dollars.\[^{[48][58]}\] By contrast, the proposed two-mile PATH extension...
The Lecture Was Slightly Different When I Was at CMU
What Is This?

Source: https://roadtrippers.com/stories/falling-water
Answer: Masterpiece of A Famous Architect

Fallingwater

Fallingwater or Kaufmann Residence is a house designed by architect Frank Lloyd Wright in 1935 in rural southwestern Pennsylvania, 43 miles (69 km) southeast of Pittsburgh.[4] The home was built partly over a waterfall on Bear Run in the Mill Run section of Stewart Township, Fayette County, Pennsylvania, in the Laurel Highlands of the Allegheny Mountains.

Time cited it after its completion as Wright's "most beautiful job";[5] it is listed among Smithsonian's Life List of 28 places "to visit before you die."[6] It was designated a National Historic Landmark in 1966.[3] In 1991, members of the American Institute of Architects named the house the "best all-time work of American architecture" and in 2007, it was ranked twenty-ninth on the list of America's Favorite Architecture according to the AIA.

You will be exposed to and hopefully develop/enhance many of these skills in this course
A Quote from The Architect Himself

- “architecture [...] based upon principle, and not upon precedent”

Source: http://www.fallingwater.org/
Organic architecture is a philosophy of architecture which promotes harmony between human habitation and the natural world through design approaches so sympathetic and well integrated with its site, that buildings, furnishings, and surroundings become part of a unified, interrelated composition.

A well-known example of organic architecture is Fallingwater, the residence Frank Lloyd Wright designed for the Kaufmann family in rural Pennsylvania. Wright had many choices to locate a home on this large site, but chose to place the home directly over the waterfall and creek creating a close, yet noisy dialog with the rushing water and the steep site. The horizontal striations of stone masonry with daring cantilevers of colored beige concrete blend with native rock outcroppings and the wooded environment.
A Key Question

- How was Wright able to design his masterpiece?
- Can have many guesses
  - (Very) hard work, perseverance, dedication (over decades)
  - Experience
  - Creativity, Out-of-the-box thinking
  - A good understanding of past designs
  - Good judgment and intuition
  - Strong skill combination (math, architecture, art, engineering, ...)

Benchmarking a New Paradigm: An Experimental Analysis of a Real Processing-in-Memory Architecture

JUAN GÓMEZ-LUNA, ETH Zürich, Switzerland
IZZAT EL HAJJ, American University of Beirut, Lebanon
IVAN FERNANDEZ, ETH Zürich, Switzerland and University of Malaga, Spain
CHRISTINA GIANNOULA, ETH Zürich, Switzerland and NTUA, Greece
GERALDO F. OLIVEIRA, ETH Zürich, Switzerland
ONUR MUTLU, ETH Zürich, Switzerland

Many modern workloads, such as neural networks, databases, and graph processing, are fundamentally memory-bound. For such workloads, the data movement between main memory and CPU cores imposes a significant overhead in terms of both latency and energy. A major reason is that this communication happens through a narrow bus with high latency and limited bandwidth, and the low data reuse in memory-bound workloads is manifest in the cost of main memory access. Fundamentally addressing this data movement bottleneck requires a paradigm where the memory system assumes an active role in computing by integrating processing capabilities. This paradigm is known as processing-in-memory (PIM).

Recent research explores different forms of PIM architectures, motivated by the emergence of new 3D-stacked memory technologies that integrate memory with a logic layer where processing elements can be easily placed. Past works evaluate these architectures in simulation or, at best, with simplified hardware prototypes. In contrast, the UPMEM company has designed and manufactured the first publicly available real-world PIM architecture. The UPMEM-PIM architecture combines traditional DRAM memory arrays with general-purpose in-order cores, called DRAM Processing Units (DPUs), integrated in the same chip.

This paper provides the first comprehensive analysis of the first publicly available real-world PIM architecture. We make two key contributions. First, we conduct an experimental characterization of the UPMEM-based PIM system using microbenchmarks to assess various architecture limits such as compute throughput and memory bandwidth, yielding new insights. Second, we present PIM (processing-in-memory benchmark suite) a benchmark suite of 16 workloads from different application domains (e.g., dense G-space linear algebra, databases, data analytics, graph processing, neural networks, bioinformatics, image processing), which identify as memory-bound. We evaluate the performance and scaling characteristics of PIM benchmarks on the UPMEM-PIM architecture, and compare their performance and energy consumption to their state-of-the-art CPU and GPU counterparts. Our extensive evaluation conducted on two real UPMEM-based PIM systems with 140 and 2,300 DPUs provides new insights about suitability of different workloads to the PIM system, programming recommendations for software designers, and suggestions and hints for hardware and architecture designers of future PIM systems.

Reading Assignments for This Week

- Chapter 1 in Harris & Harris
- Chapters 1-2 in Patt and Patel
- Supplementary Lecture Slides on Binary Numbers
Recall: High-Level Goals of This Course

- In Digital Design & Computer Architecture
- Understand the basics
- Understand the principles (of design)
- Understand the precedents

Based on such understanding:
- learn how a modern computer works underneath
- evaluate tradeoffs of different designs and ideas
- implement a principled design (a simple microprocessor)
- learn to systematically debug increasingly complex systems
- Hopefully enable you to develop novel, out-of-the-box designs

The focus is on basics, principles, precedents, and how to use them to create/implement good designs
Recall: Why These Goals?

- Because you are here for a Computer Science degree!

- Regardless of your future direction, learning the principles of digital design & computer architecture will be useful to
  - design better hardware
  - design better software
  - design better systems
  - make better tradeoffs in design
  - understand why computers behave the way they do
  - solve problems better
  - think “in parallel”
  - think critically
  - ...

- Lecturers and Teaching Assistants
Lecture and Lab Times and Policies

- Lectures:
  - Thursday and Fridays, 14:00-16:00
  - YouTube livestream playlist: https://www.youtube.com/playlist?list=PL5Q2soXY2Zi-EImKxYYY1SZuGiOAOBKaf
  - Zoom link provided via Moodle
  - Attendance is for your benefit and is therefore important
  - Some days, we may have guest lectures and exercise sessions

- Lab sessions:
  - See online
  - You should definitely attend the lab sessions
    - In-class evaluation (70%) and mandatory lab reports (30%)
  - Labs will start on March 7th
  - Lab information and handouts are here:
Lab Organization (I)

- Groups

  - Choose your preferred group in Moodle
    - Due 03.03.2023 at 11:59pm

  - Choose your partner
    - Due 03.03.2023 at 11:59pm

  - Choose onsite or online
    - Due 03.03.2023 at 11:59pm
Lab Organization (II)

- Lab grades from previous years
  - [link](https://moodle-app2.let.ethz.ch/mod/choice/view.php?id=877115)

- Choose one of the options (due **03.03.2023 at 11:59pm**):
  - 1) I will use my lab grades from previous years, and I won't do the labs this year
  - 2) I will use my lab grades from previous years, but I will do the labs this year
  - 3) I won't use my lab grades from previous years. I will do the labs this year
Final Exam

- 180-minute written exam

- Find examination rules in Course Catalogue

- Also: study the first pages of previous exams

- Some exam questions are similar to questions in Optional HWs and Past Exams
  - Optional HWs are not graded, but highly recommended to solve
  - Solving past exams could also be useful
Reading Assignments for This Week

- Chapter 1 in Harris & Harris
- Supplementary Lecture Slides on Binary Numbers
- Chapters 1-2 in Patt and Patel
Reading Assignments for Next Week

- Combinational Logic chapters from both books
  - Patt and Patel, Chapter 3
  - Harris and Harris, Chapter 2

- Check course website for all future readings
  - Required
  - Recommended
  - Mentioned
Future Lectures and Assignments

- You can also anticipate (and plan for) future lectures and assignments based on Spring 2022 schedule:
  - https://safari.ethz.ch/digitaltechnik/spring2022/doku.php?id=schedule
  - https://www.youtube.com/playlist?list=PL5Q2soXY2Zi97Ya5DEUpMpO2bbAoAG7c6

- An example of “Last Time Prediction”
  - Speculative Execution
    - The concept of doing something before knowing it is needed
  - A key concept we will cover in the design of microprocessors
