Our Work

Efficient Algorithmic Designs

The first open-source Sparse Matrix Vector Multiplication (SpMV) software package, SparseP, for real Processing-In-Memory (PIM) systems

SparseP is Open-Source

SparseP: https://github.com/CMU-SAFARI/SparseP

Extensive Characterization

The first comprehensive analysis of SpMV on the first real commercial PIM architecture

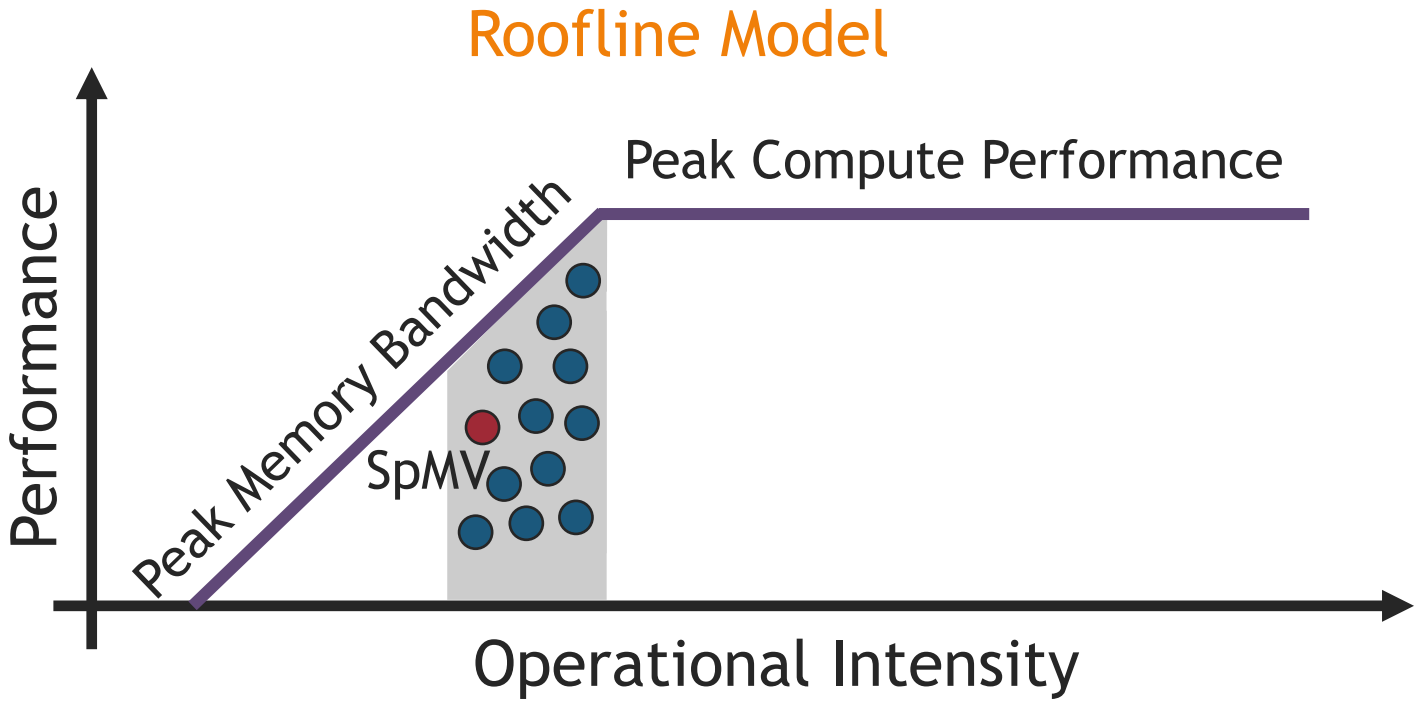
Recommendations for Architects and Programmers

Full Paper: https://arxiv.org/pdf/2201.05072.pdf

Sparse Matrix Vector Multiplication

Sparse Matrix Vector Multiplication (SpMV):

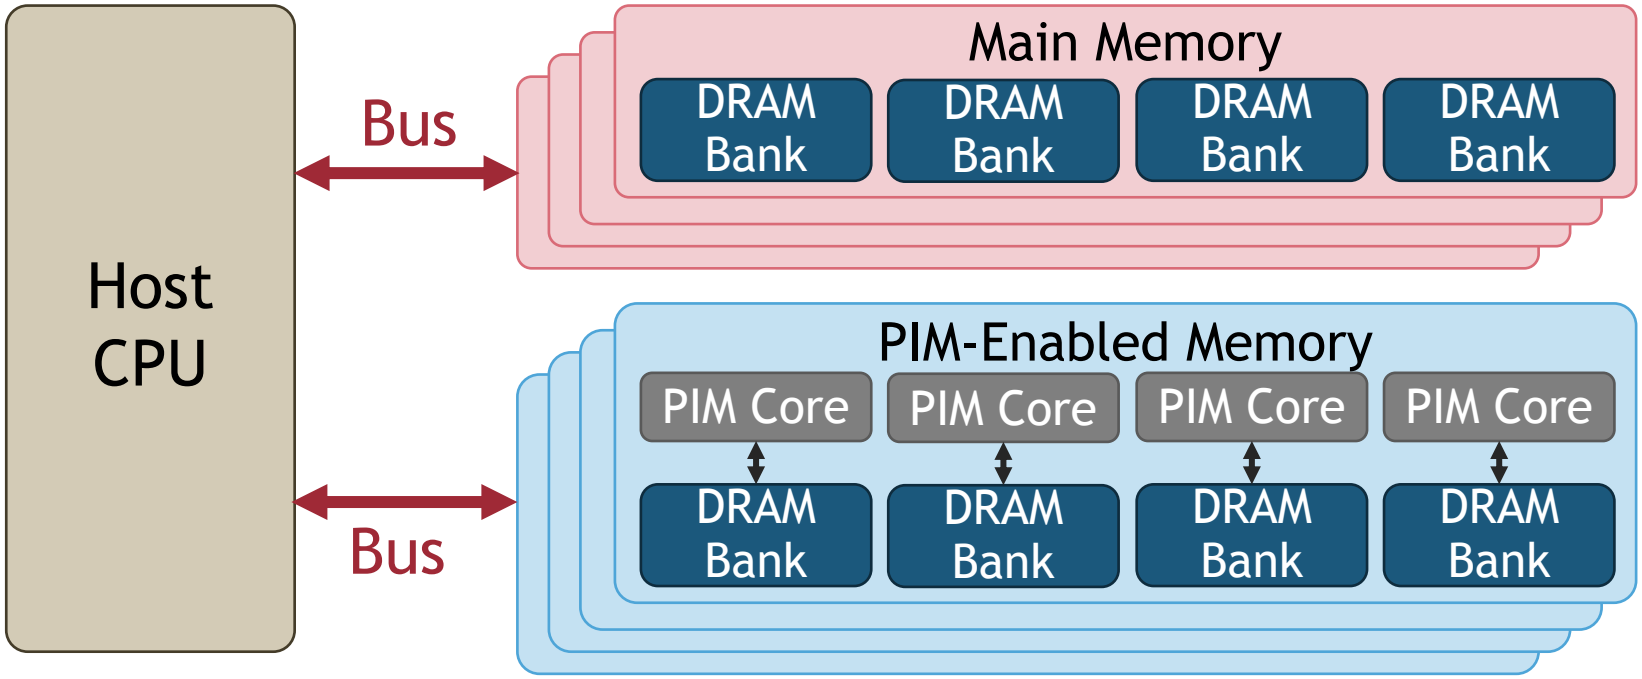
- Widely-used kernel in graph processing, machine learning, scientific computing …
- A highly memory-bound kernel



Real Processing-In-Memory Systems

Real Near-Bank Processing-In-Memory (PIM) Systems:

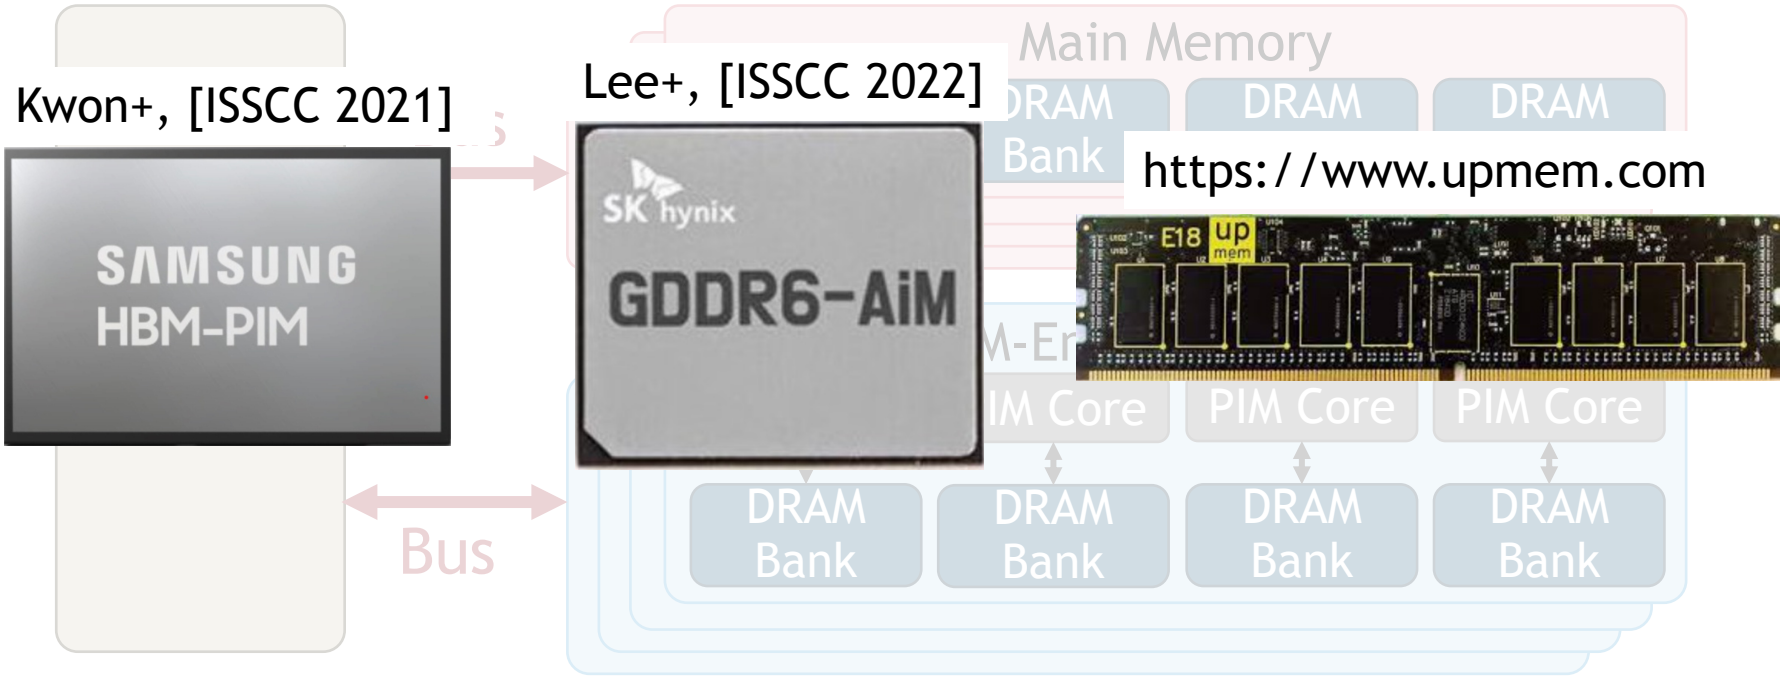
- High levels of parallelism
- Low memory access latency
- Large aggregate memory bandwidth



Real Processing-In-Memory Systems

Real Near-Bank Processing-In-Memory (PIM) Systems:

- High levels of parallelism
- Low memory access latency
- Large aggregate memory bandwidth



SparseP: SpMV Library for Real PIMs

Our Contributions:

1. Design efficient SpMV kernels for current and future PIM systems
   - 25 SpMV kernels
     - 4 compressed matrix formats (CSR, COO, BCSR, BCOO)
     - 6 data types
     - 4 data partitioning techniques
     - Various load balancing schemes among PIM cores/threads
     - 3 synchronization approaches

2. Provide a comprehensive analysis of SpMV on the first commercially-available real PIM system **upmem**
   - 26 sparse matrices
   - Comparisons to state-of-the-art CPU and GPU systems
   - Recommendations for software, system and hardware designers

Outline

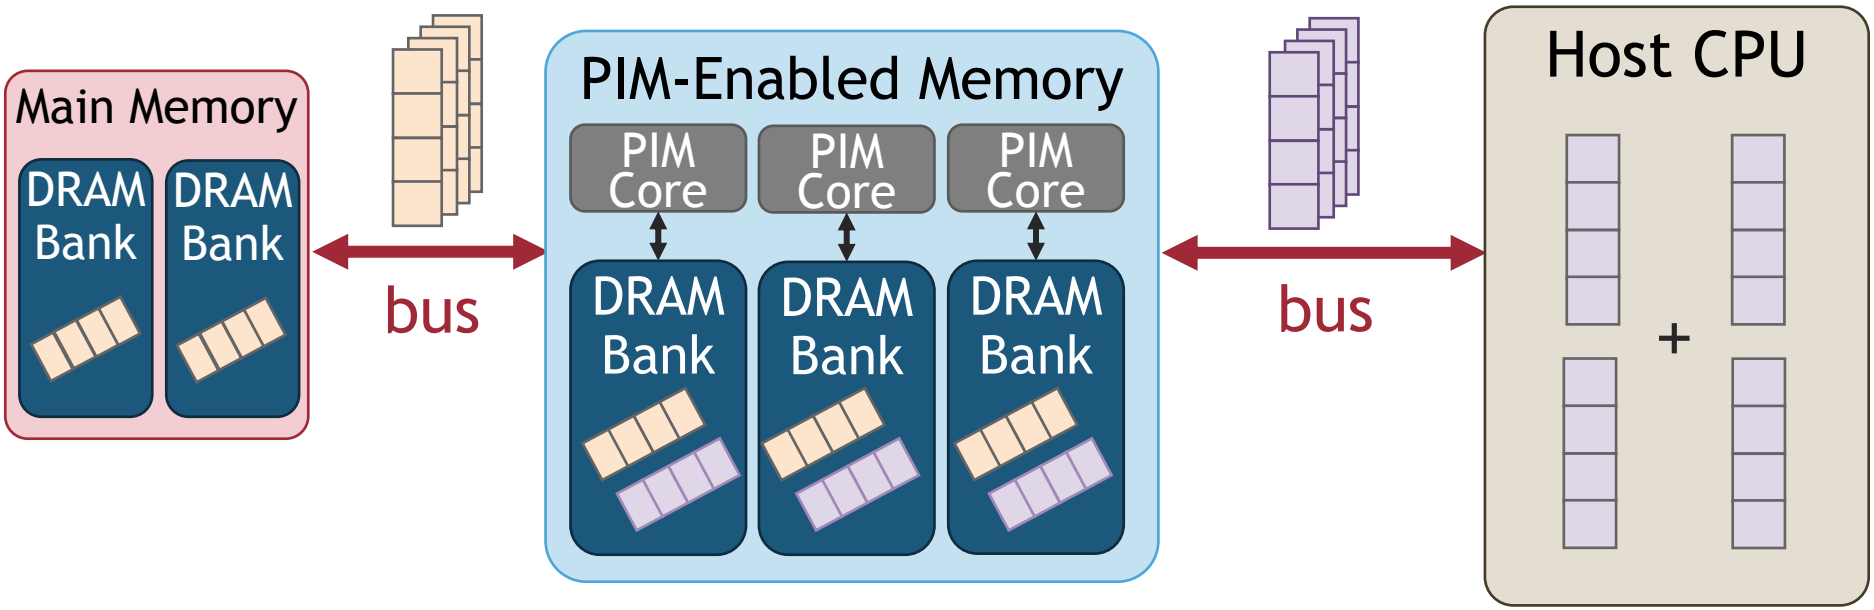
SpMV Kernels for Real PIM Systems

Key Takeaways from Our Study

Conclusion

SpMV Execution on a PIM System

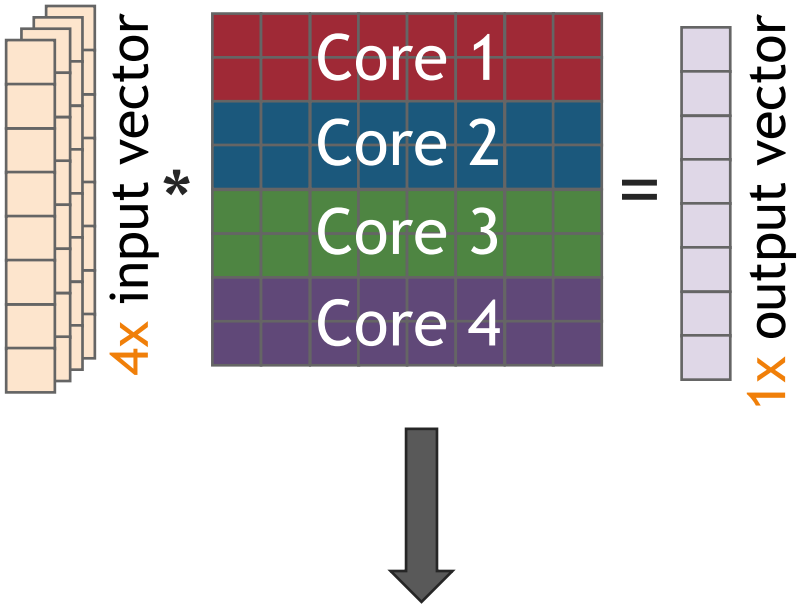
1. Load the input vector
2. Execute the kernel
3. Retrieve the partial results
4. Merge the partial results



Data Partitioning Techniques

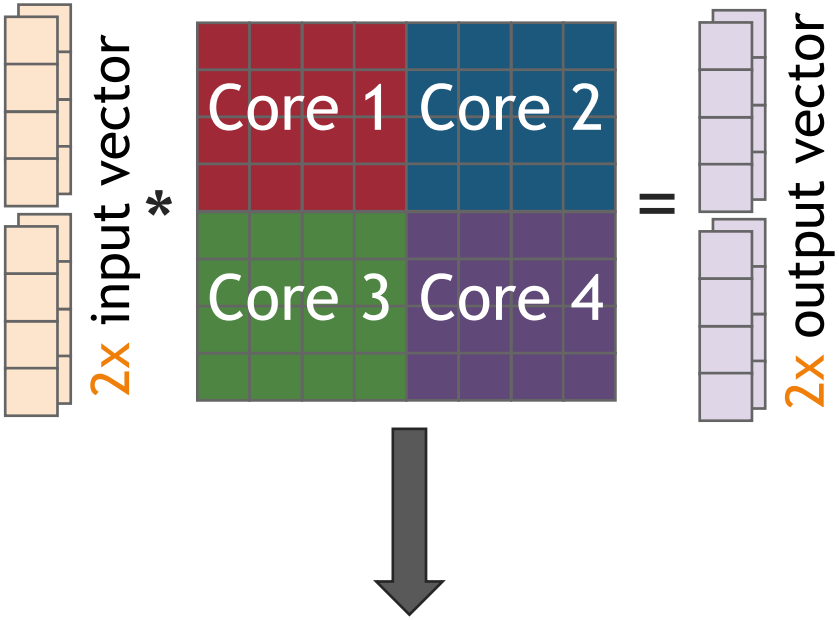
SparseP supports two types of data partitioning techniques:

1D Partitioning



perform the complete SpMV computation only on PIM cores

2D Partitioning



trade-off computation vs data transfer costs

1D Partitioning Technique

Load-Balancing Approaches:

- CSR, COO:
  - Balance Rows
  - Balance NNZs *

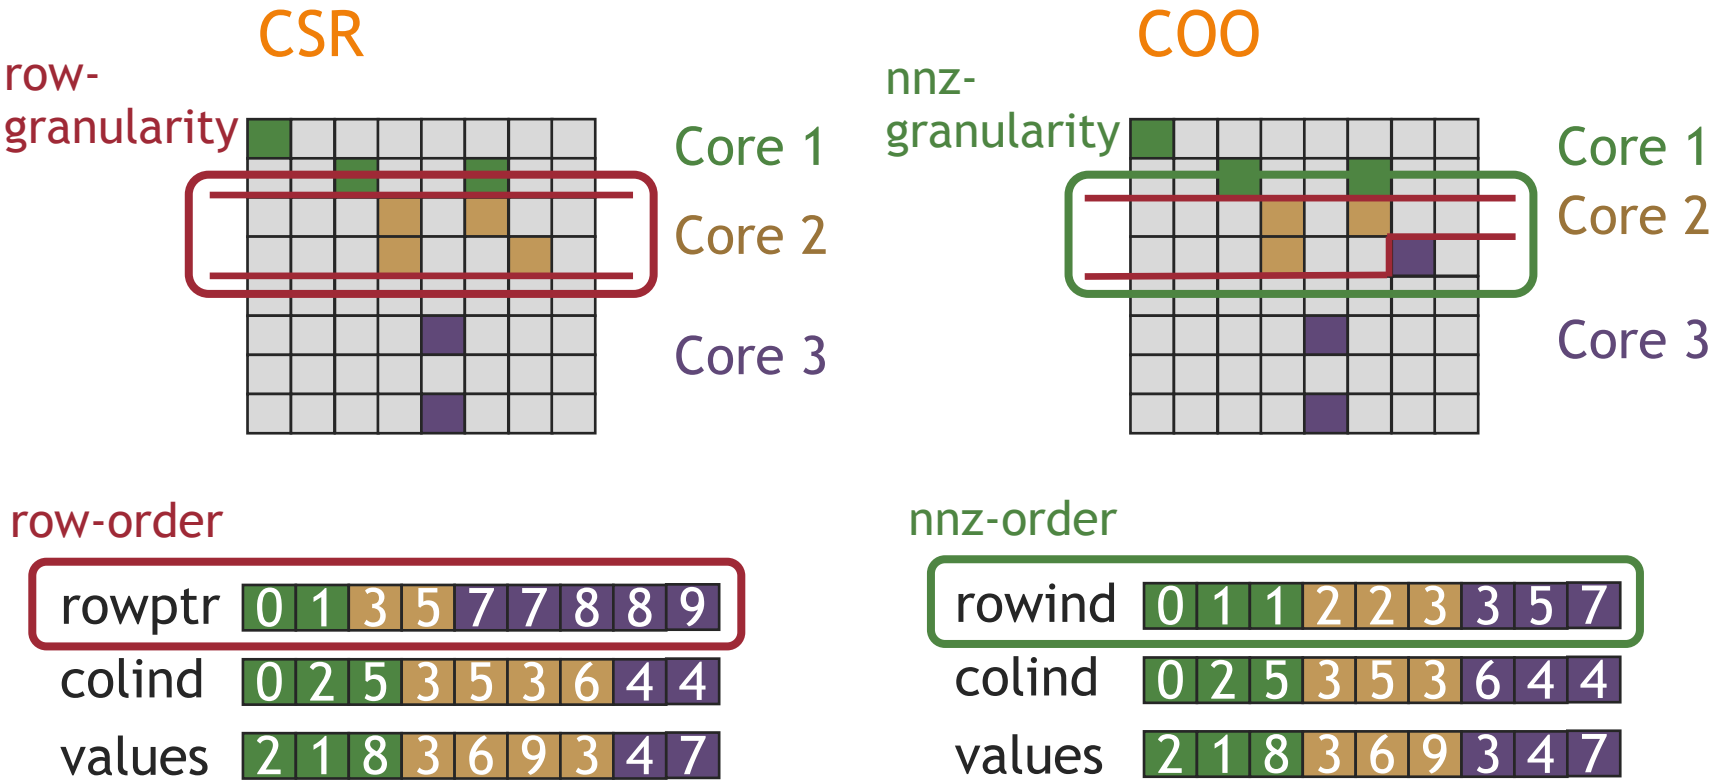
- BCSR, BCOO:
  - Balance Blocks ^
  - Balance NNZs ^

* row-granularity for CSR
^ block-row-granularity for BCSR

1D Partitioning Technique

Load-Balancing of #NNZs:

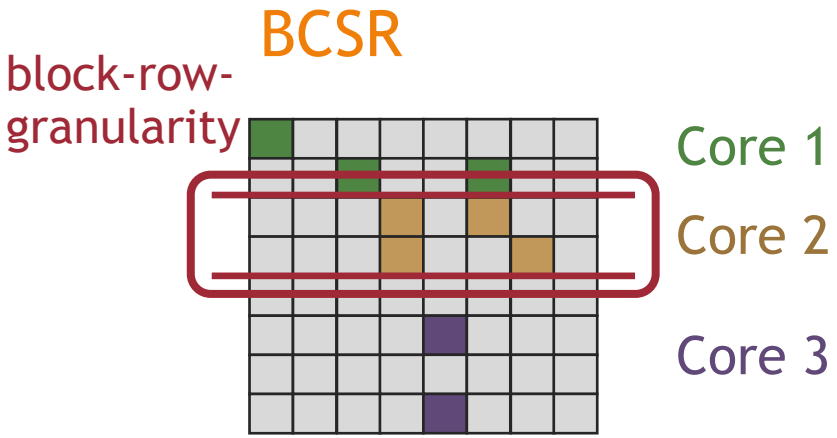
- CSR (row-granularity), COO

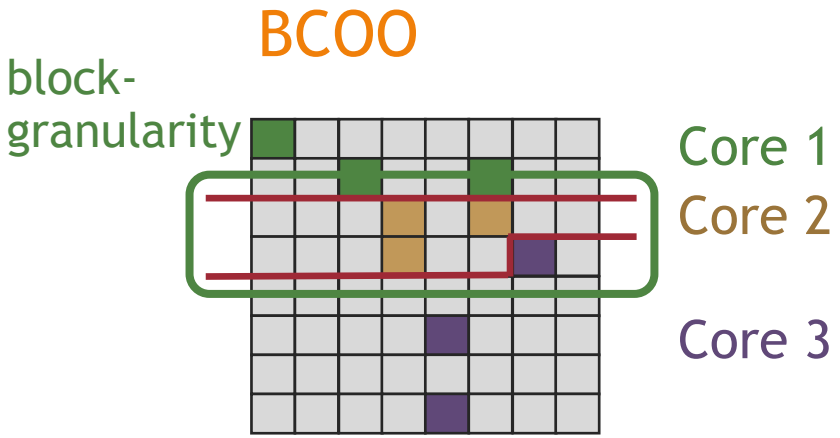


1D Partitioning Technique

Load-Balancing of #NNZs:

- CSR (row-granularity), COO
- BCSR (block-row-granularity), BCOO





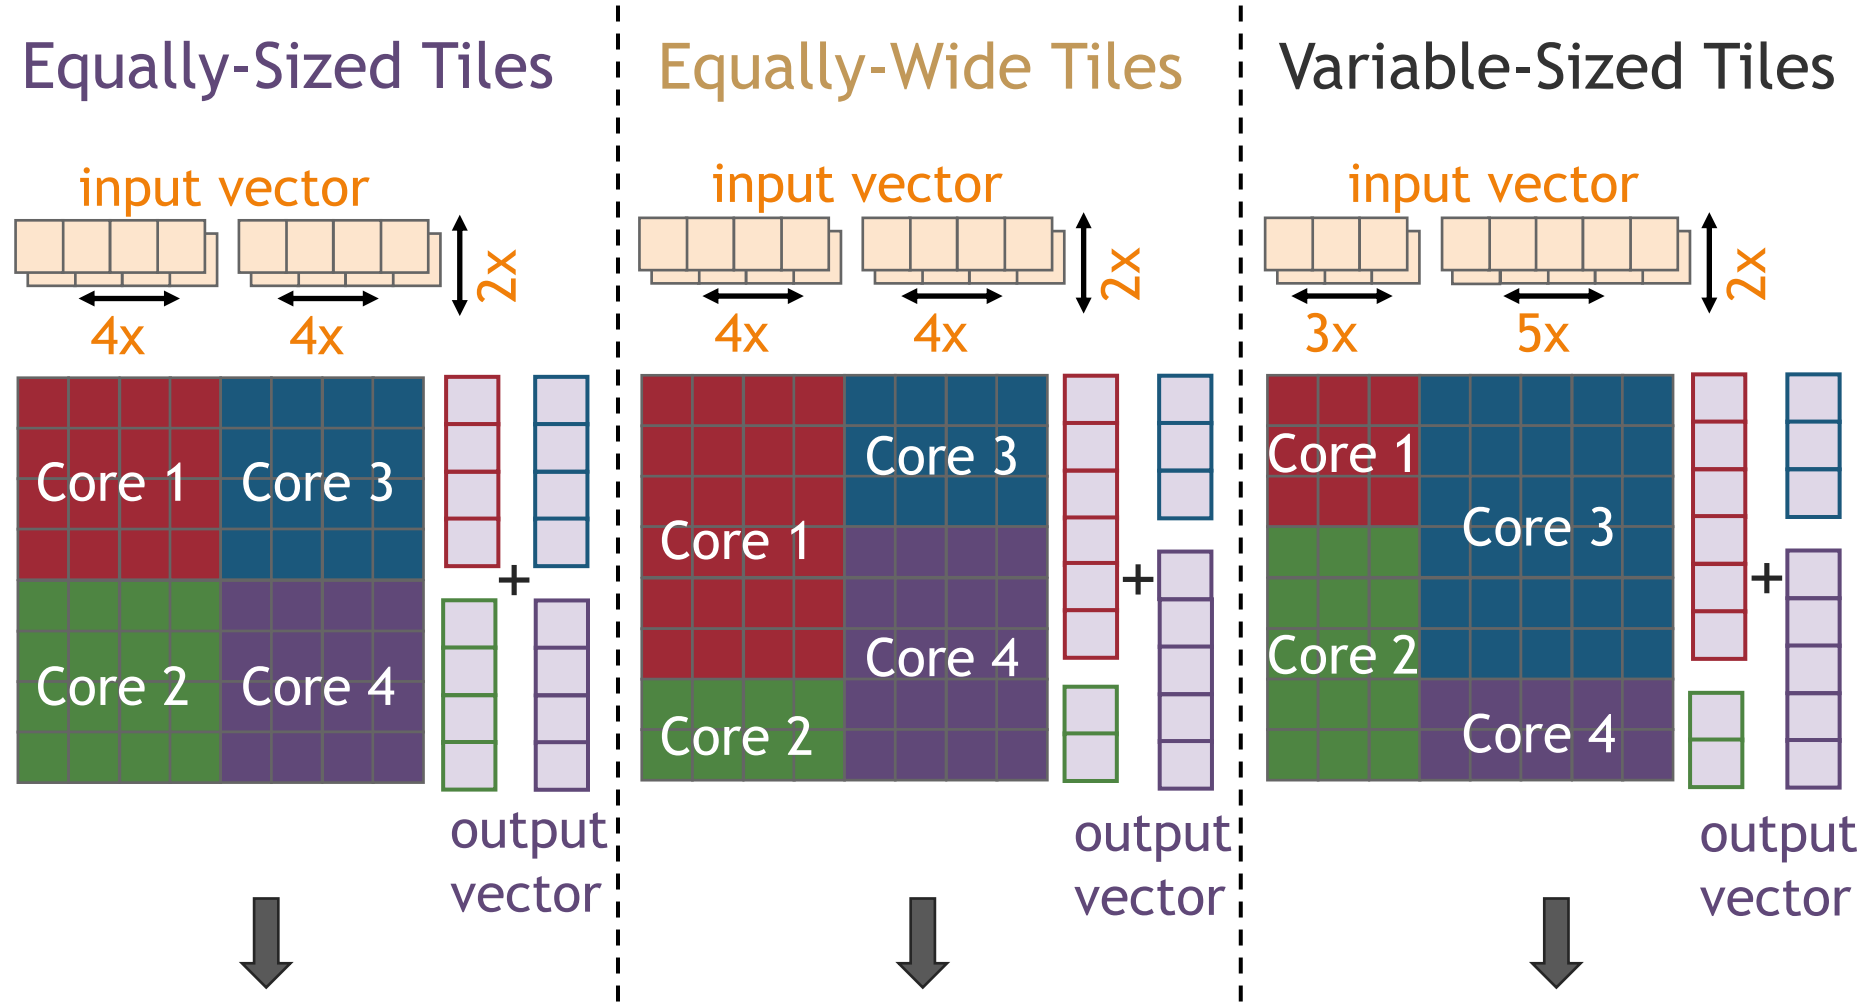
block-row-order

rowptr	0	1	3	5	7	7	8	8	9
colind	0	2	5	3	5	3	6	4	4
values	2	1	8	3	6	9	3	4	7

block-order

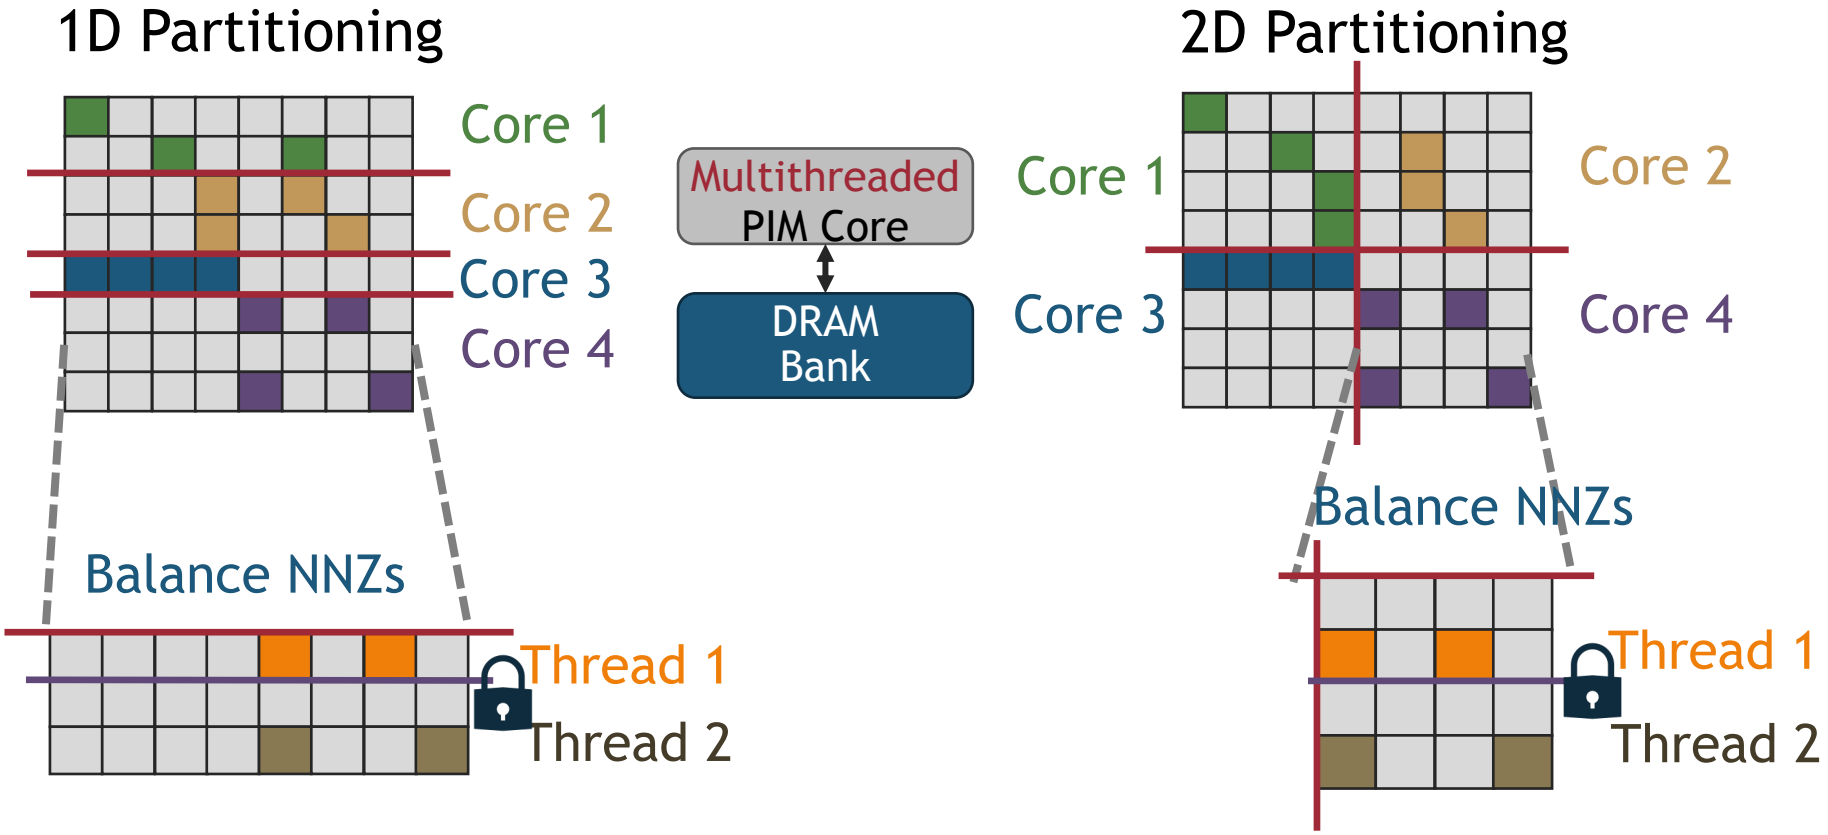
rowind	0	1	1	2	2	3	3	5	7
colind	0	2	5	3	5	3	6	4	4
values	2	1	8	3	6	9	3	4	7

2D Partitioning Technique



Parallelization across Threads

Multithreaded PIM Cores:



- Various load-balance schemes across threads
- Various synchronization approaches among threads

SparseP Software Package

25 SpMV kernels for PIM Systems →
https://github.com/CMU-SAFARI/SparseP

Partitioning	Matrix Format	Load-Balancing
9x 1D Kernels	CSR	rows, nnzs *
	COO ▲	rows, nnzs *, nnzs
	BCSR	blocks ^, nnzs ^
	BCOO ▲	blocks, nnzs
4x 2D Equally-Sized Tiles	CSR	--
	COO ▲	--
	BCSR	--
	BCOO ▲	--
6x 2D Equally-Wide Tiles	CSR	nnzs *
	COO ▲	nnzs
	BCSR	blocks ^, nnzs ^
	BCOO ▲	blocks, nnzs
6x 2D Variable-Sized Tiles	CSR	nnzs *
	COO ▲	nnzs
	BCSR	blocks ^, nnzs ^
	BCOO ▲	blocks, nnz

Load-balance
across PIM cores/threads:
* row-granularity (CSR)
^ block-row-granularity (BCSR)

Synchronization
among threads of a PIM core:
▲ lb-cg, lb-fb, lf (COO, BCOO)

Data Types:
- 8-bit integer
- 16-bit integer
- 32-bit integer
- 64-bit integer
- 32-bit float
- 64-bit float

Outline

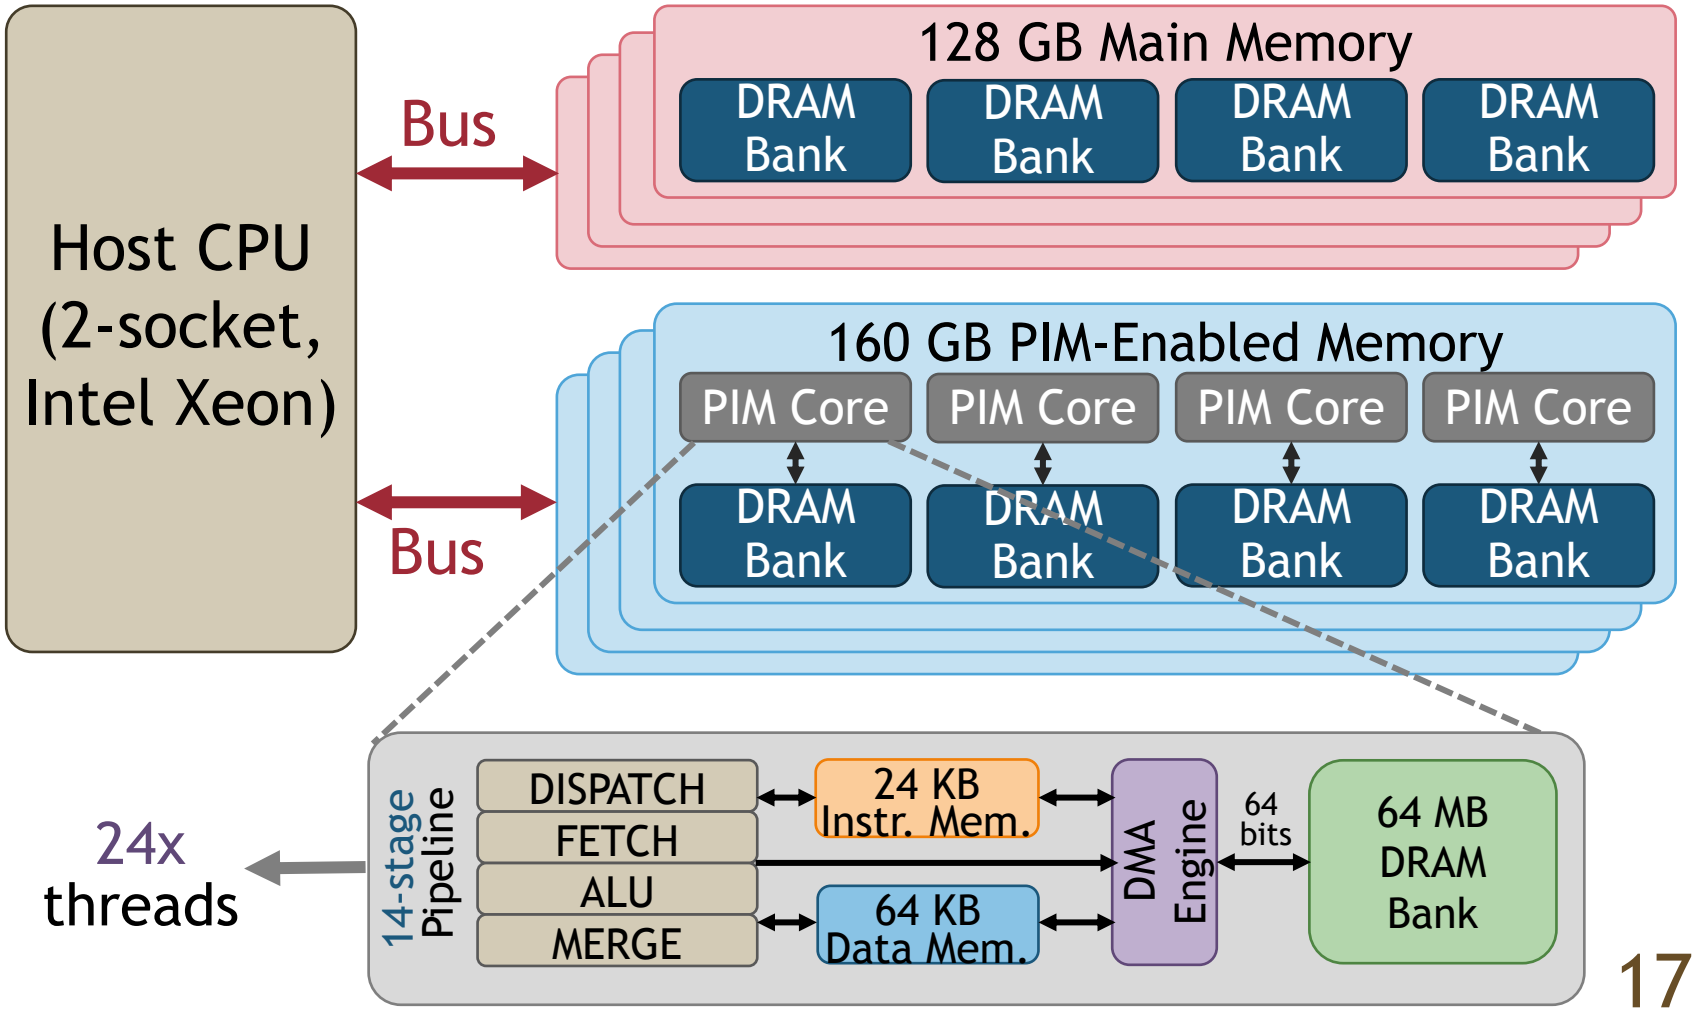
SpMV Kernels for Real PIM Systems

Key Takeaways from Our Study

Conclusion

UPMEM-based PIM System

- 20 UPMEM PIM DIMMs with 2560 PIM cores in total
- Each multithreaded PIM core supports 24 threads

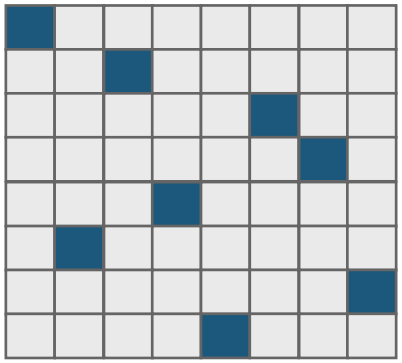


Sparse Matrix Data Set

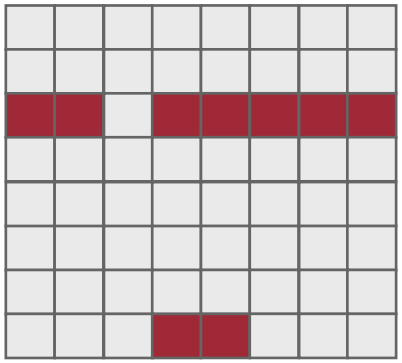
26 sparse matrices*:

- Diverse sparsity patterns
- Variability on irregular patterns
- Variability on block patterns

Regular Matrix



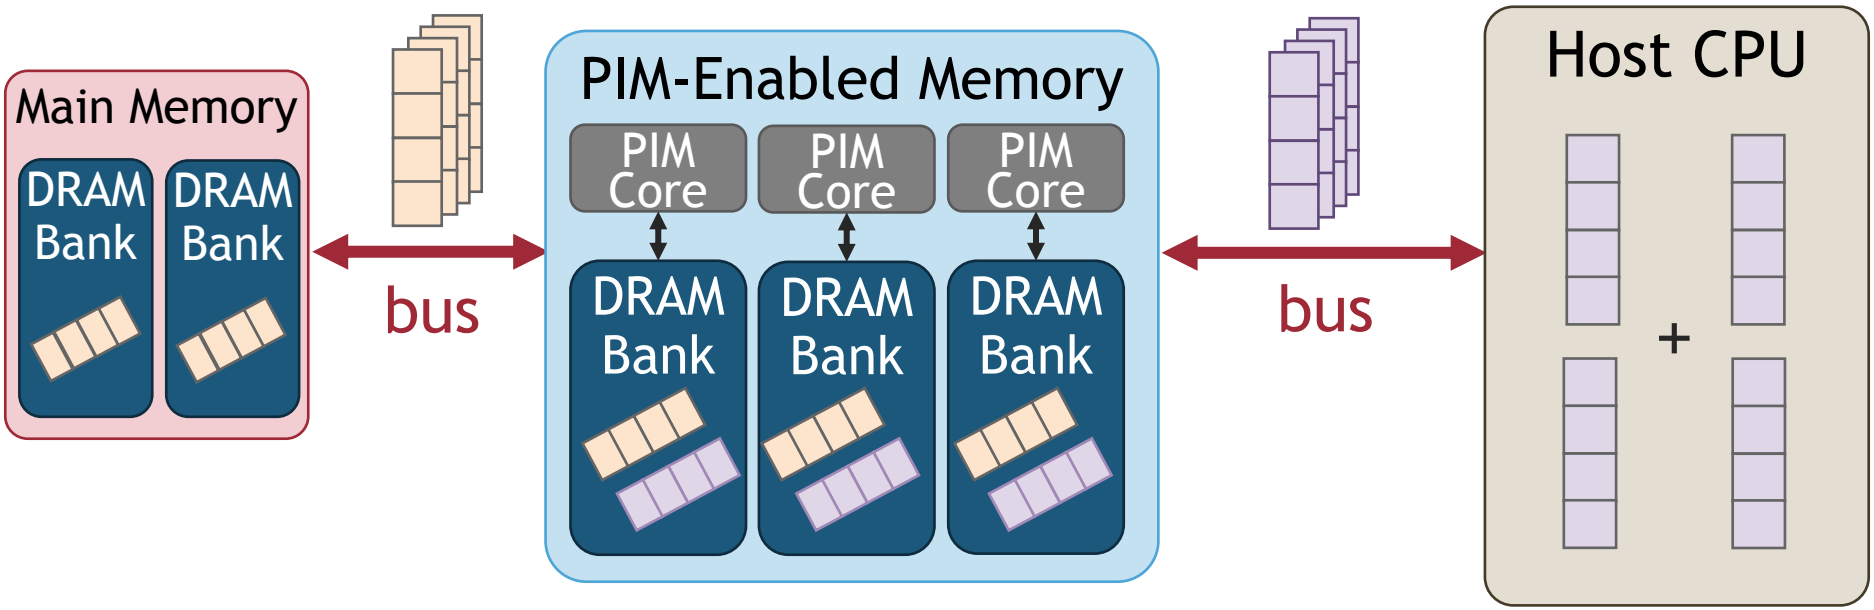
Scale-Free Matrix



* Suite Sparse Matrix Collection: https://sparse.tamu.edu/

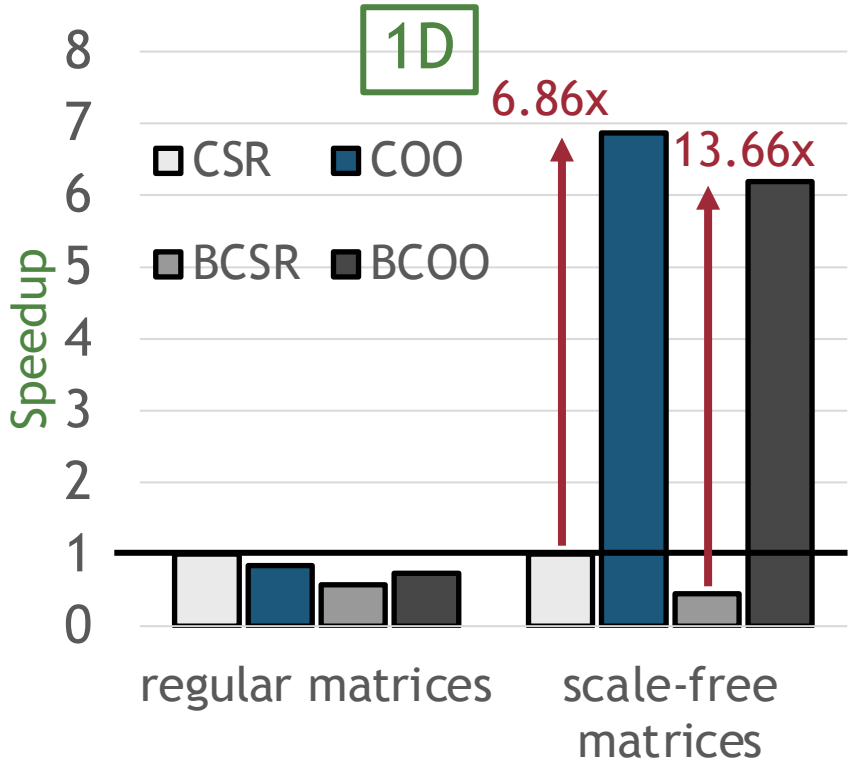
Kernel Execution on PIM Cores

1. Load the input vector
2. Execute the kernel
3. Retrieve the partial results
4. Merge the partial results

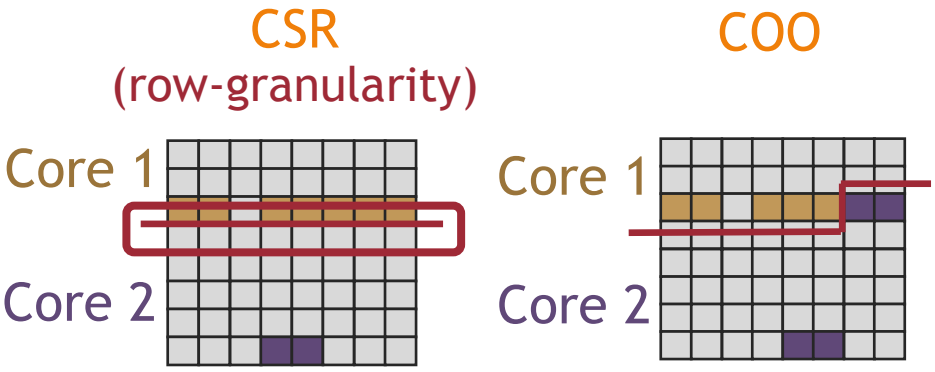


Comparison of Compressed Formats

2048 PIM Cores, 32-bit integer



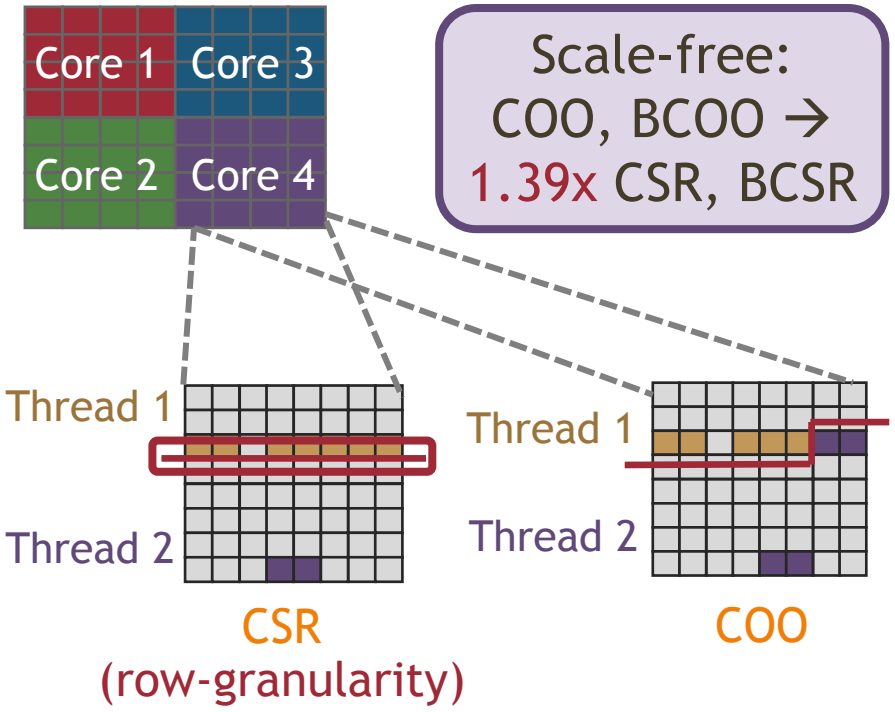
Scale-free: COO, BCOO → 10.26x CSR, BCSR

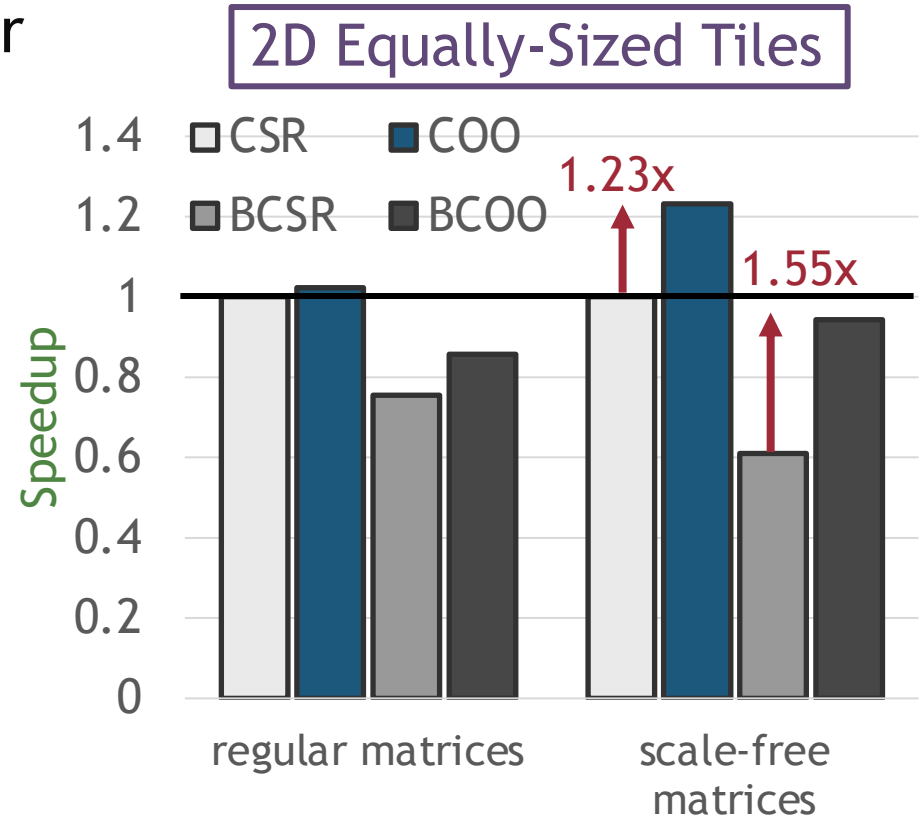


In scale-free matrices, COO + BCOO provide higher non-zero element balance across PIM cores than CSR + BCSR, respectively.

Comparison of Compressed Formats

2048 PIM Cores, 32-bit integer



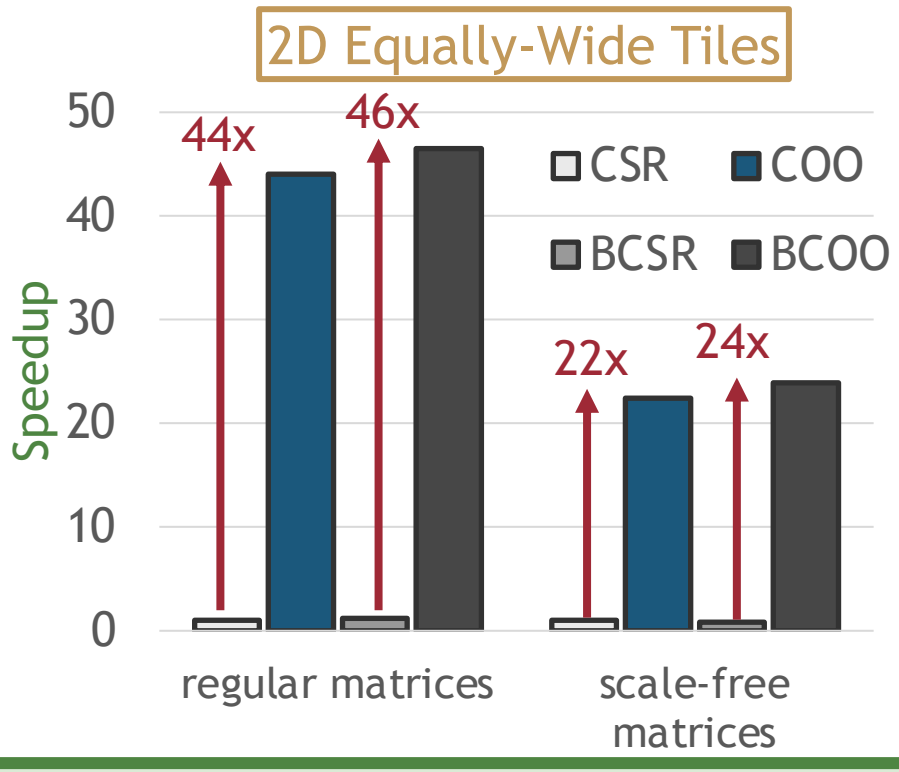


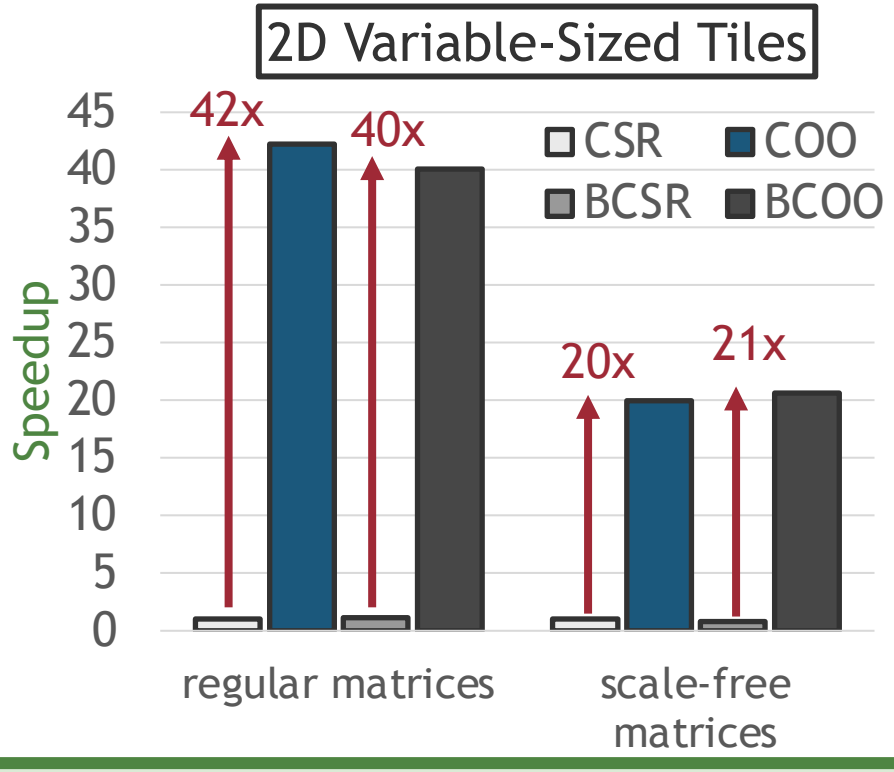
In scale-free matrices, COO + BCOO provide higher non-zero element balance across threads than CSR + BCSR, respectively.

Comparison of Compressed Formats

2048 PIM Cores, 32-bit integer

COO, BCOO → 32.38x CSR, BCSR

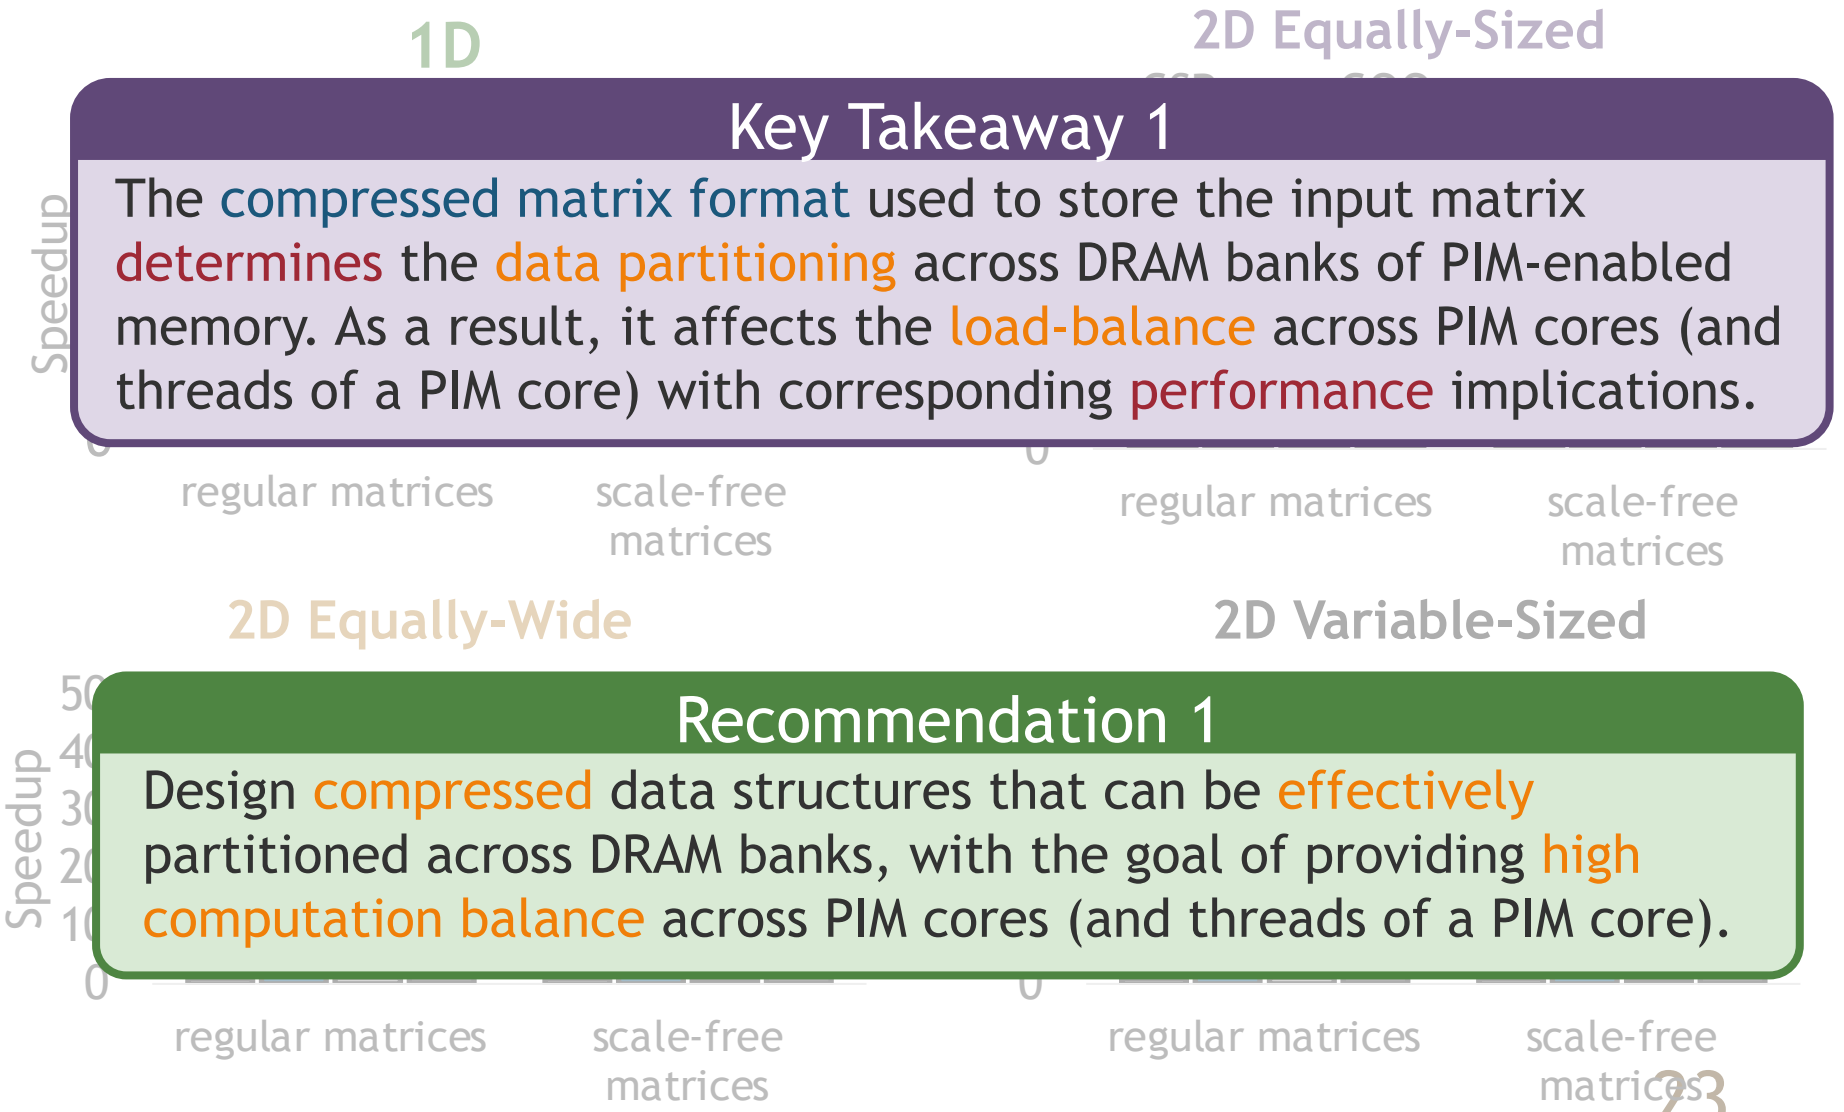




COO + BCOO formats provide higher non-zero element balance across PIM cores + threads than CSR + BCSR, respectively.

Comparison of Compressed Formats

2048 PIM Cores, 32-bit integer



Key Takeaway 1

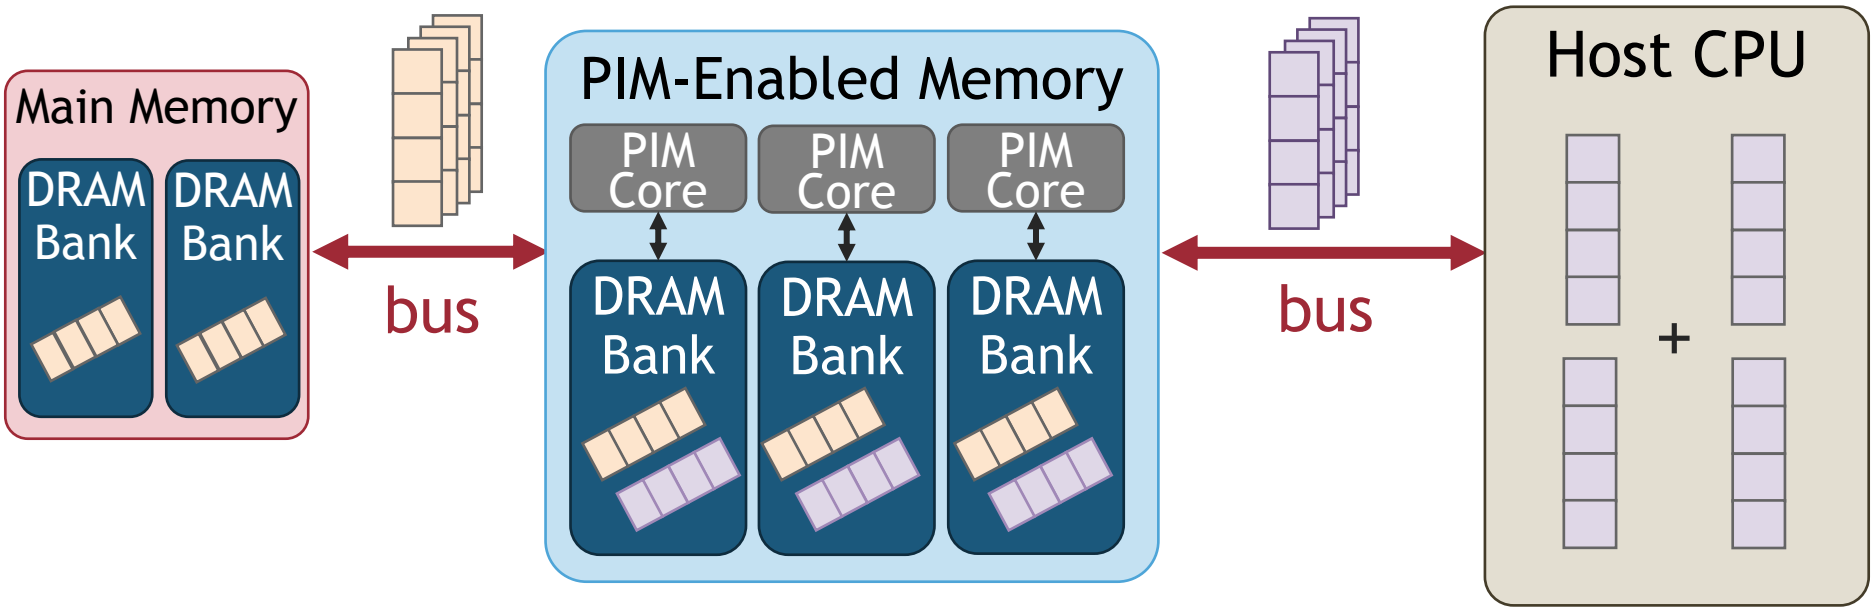
The compressed matrix format used to store the input matrix determines the data partitioning across DRAM banks of PIM-enabled memory. As a result, it affects the load-balance across PIM cores (and threads of a PIM core) with corresponding performance implications.

Recommendation 1

Design compressed data structures that can be effectively partitioned across DRAM banks, with the goal of providing high computation balance across PIM cores (and threads of a PIM core).

End-to-End Performance

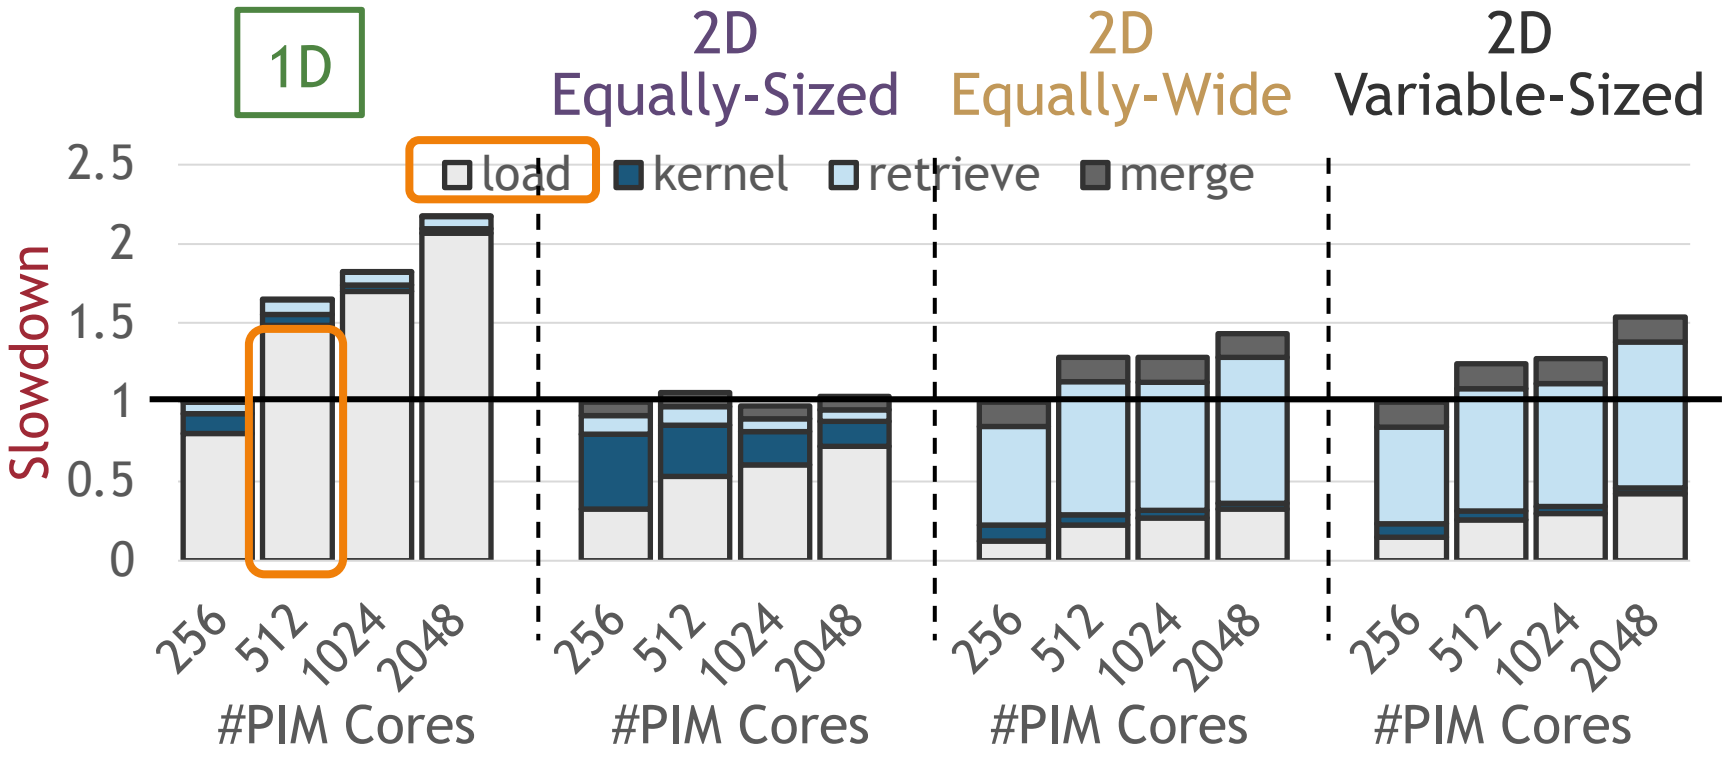
1. Load the input vector
2. Execute the kernel
3. Retrieve the partial results
4. Merge the partial results



Scalability

COO format, 32-bit integer

The scalability is limited by the load time



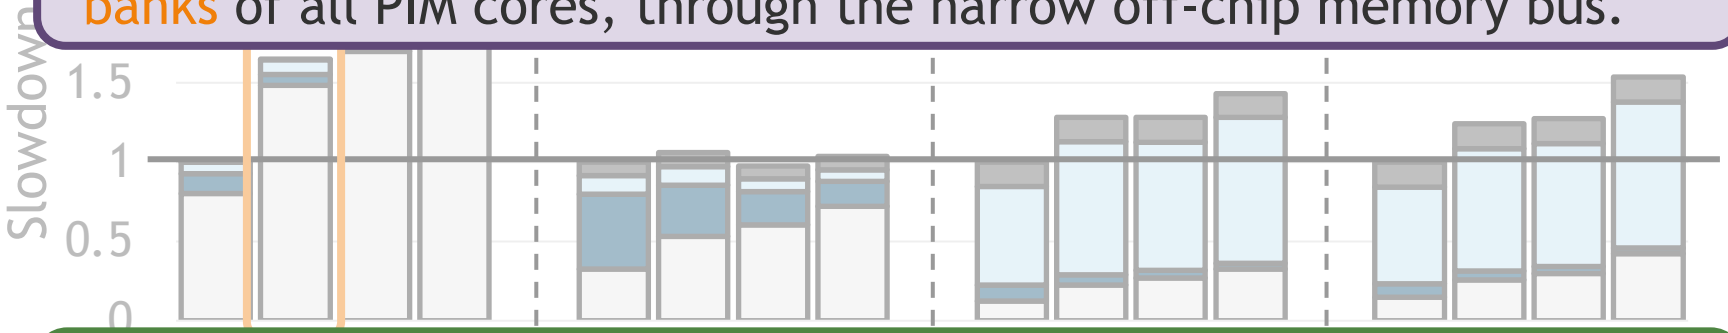
1D: #bytes to load the input vector grows linearly to #PIM cores

Scalability

COO format, 32-bit integer

Key Takeaway 2

The 1D-partitioned kernels are severely bottlenecked by the high data transfer costs to broadcast the whole input vector into DRAM banks of all PIM cores, through the narrow off-chip memory bus.



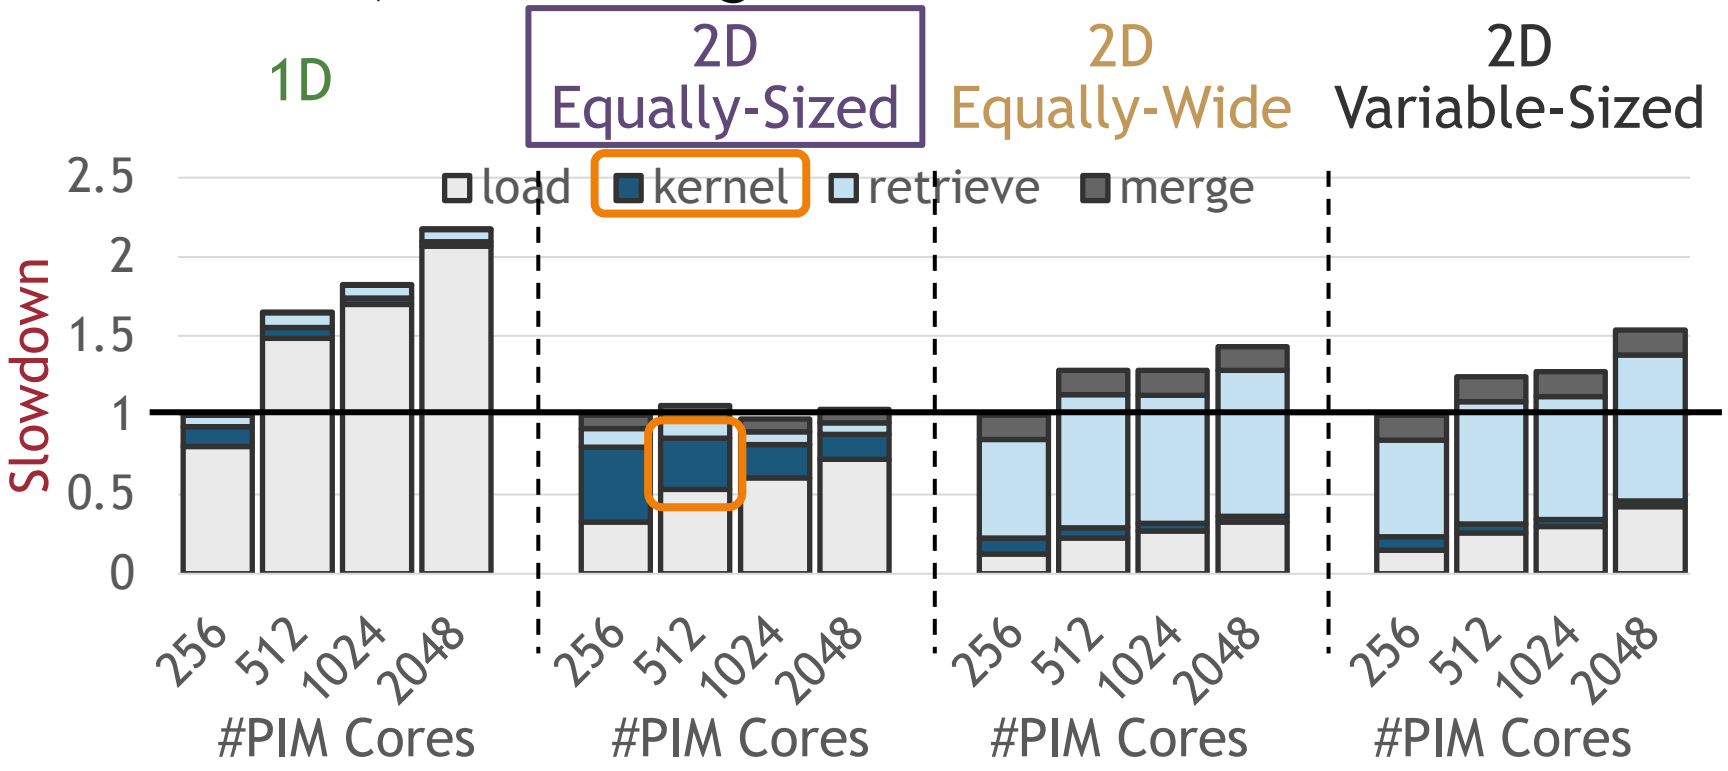
Recommendation 2

Optimize the broadcast collective collective in data transfers to PIM-enabled memory to efficiently copy the input data into DRAM banks in the PIM system.

Scalability

COO format, 32-bit integer

The scalability is limited by the kernel time

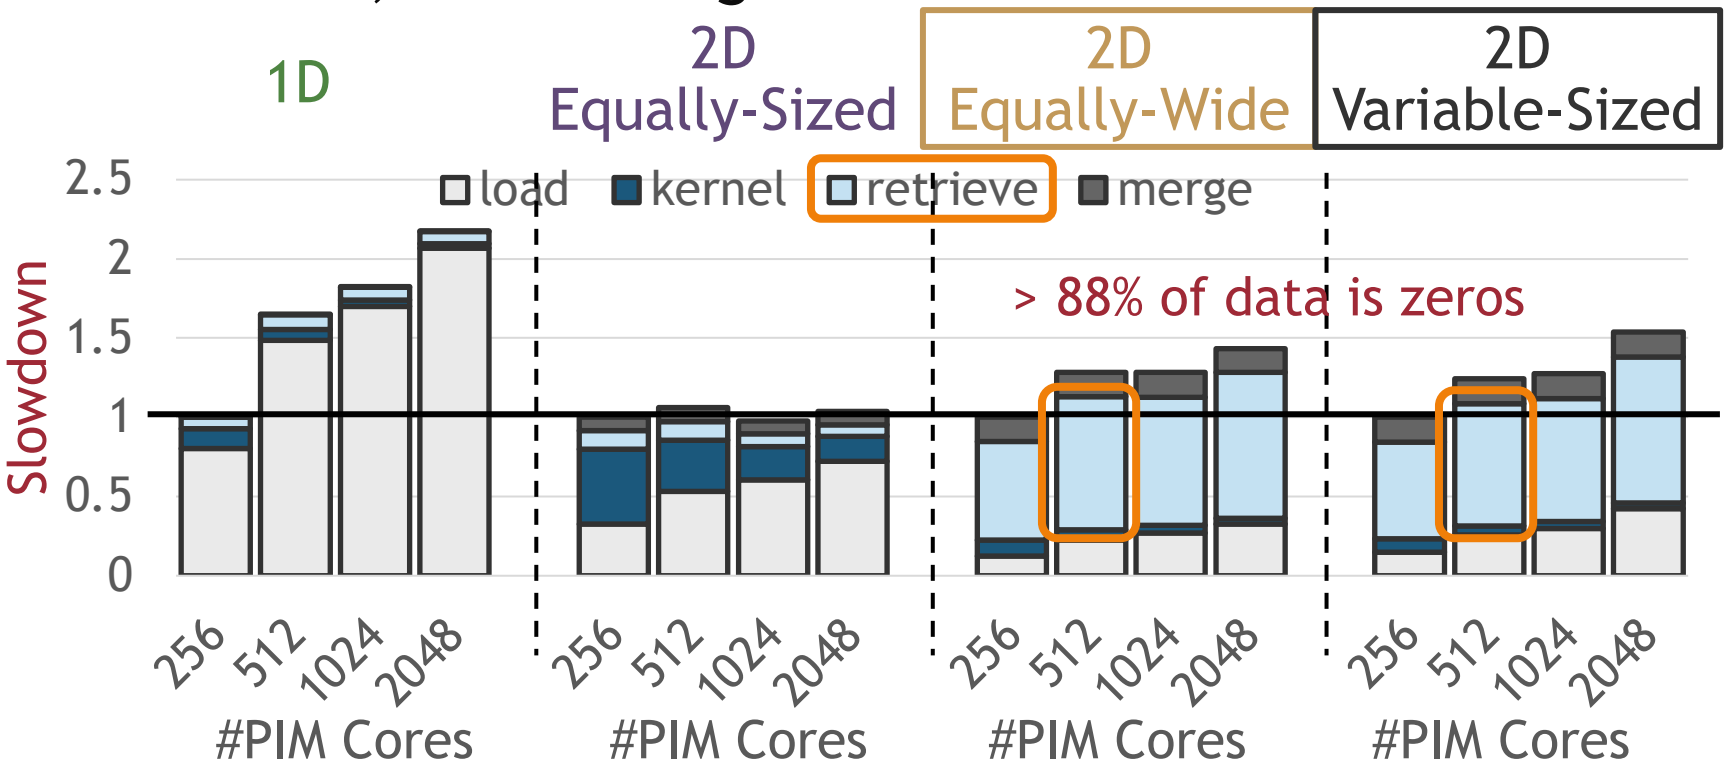


2D Equally-Sized: kernel time is limited by only a few PIM cores assigned to the 2D tiles with the largest #NNZs

Scalability

COO format, 32-bit integer

The scalability is limited by the retrieve time



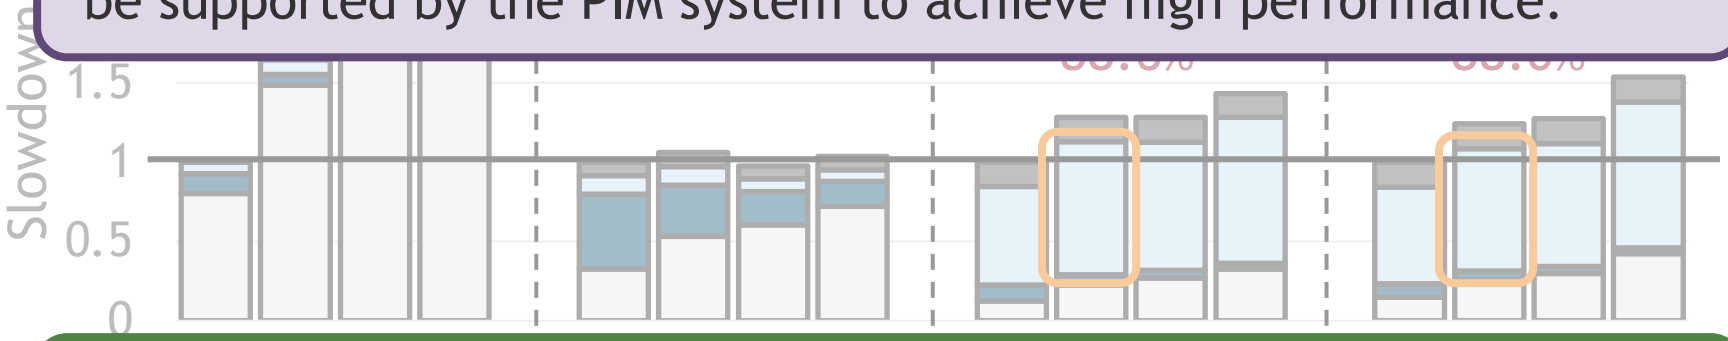
2D Equally-Wide + 2D Variable-Sized:
high amount of zero padding to gather the output vector →
parallel transfers supported at rank granularity = 64 PIM cores

Scalability

COO format, 32-bit integer

Key Takeaway 3

The 2D equally-wide and variable-sized kernels need fine-grained parallel data transfers at DRAM bank granularity (zero padding) to be supported by the PIM system to achieve high performance.

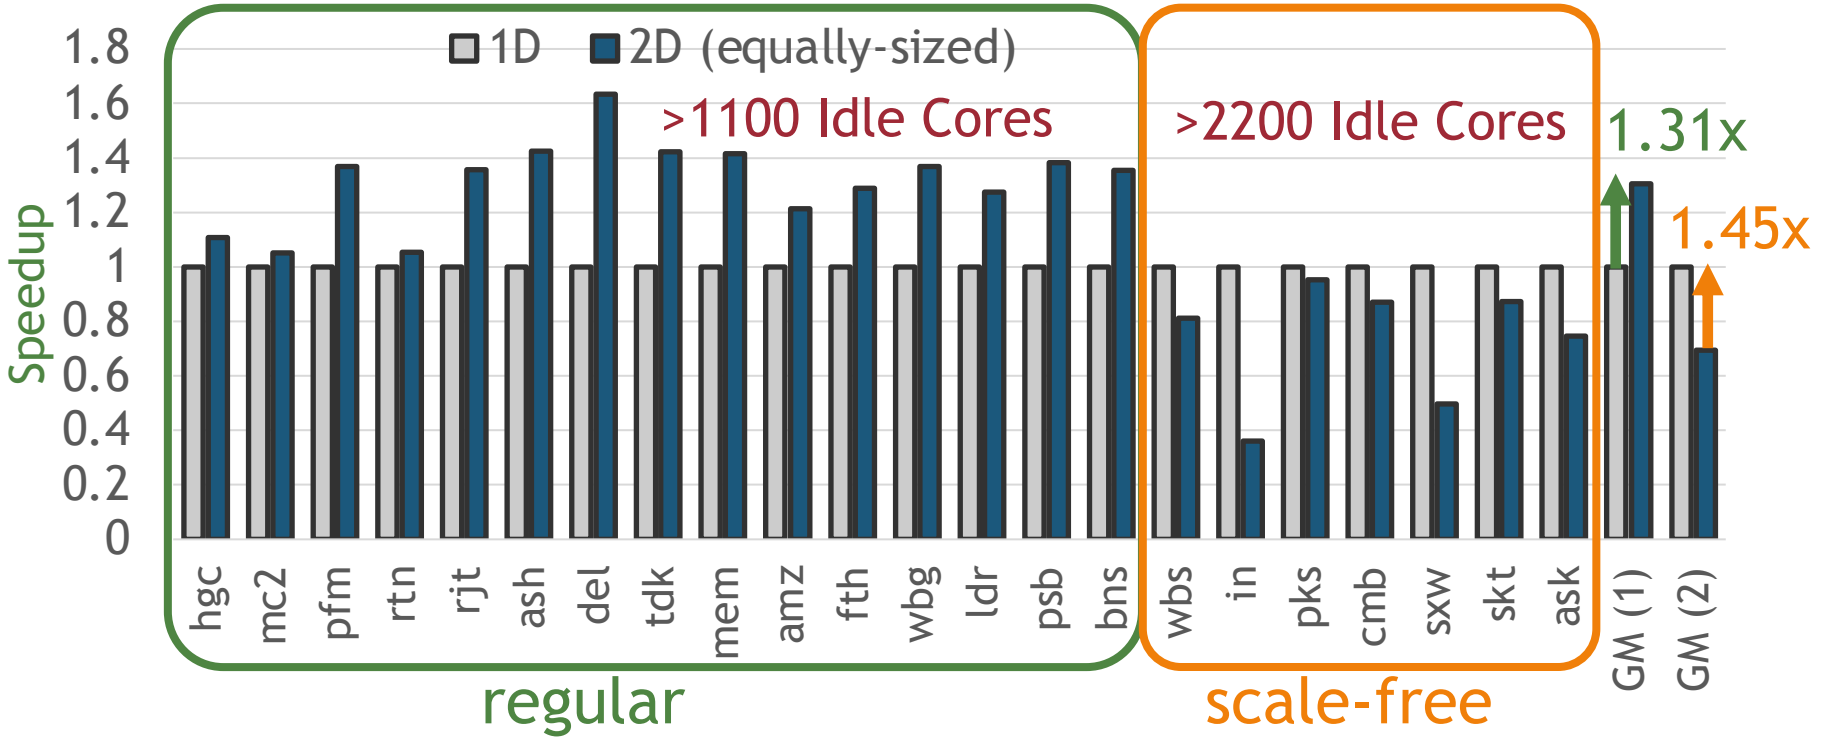


Recommendation 3

Optimize the gather collective operation at DRAM bank granularity in data transfers from PIM-enabled memory to efficiently retrieve the output results to the host CPU.

1D vs 2D

Up to 2528 PIM Cores, 32-bit float

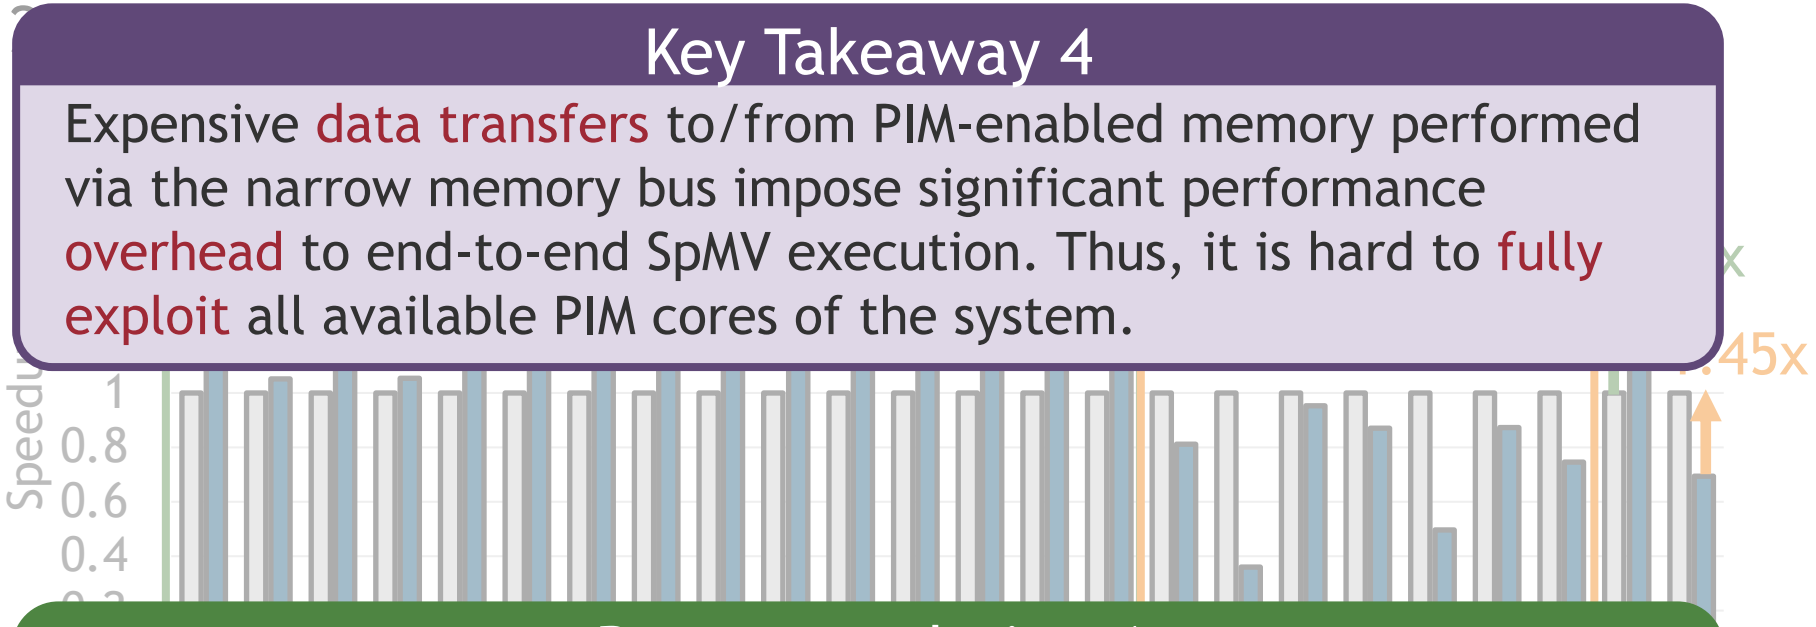


Best-performing SpMV execution:
trades off computation with lower data transfer costs

1D vs 2D

Key Takeaway 4

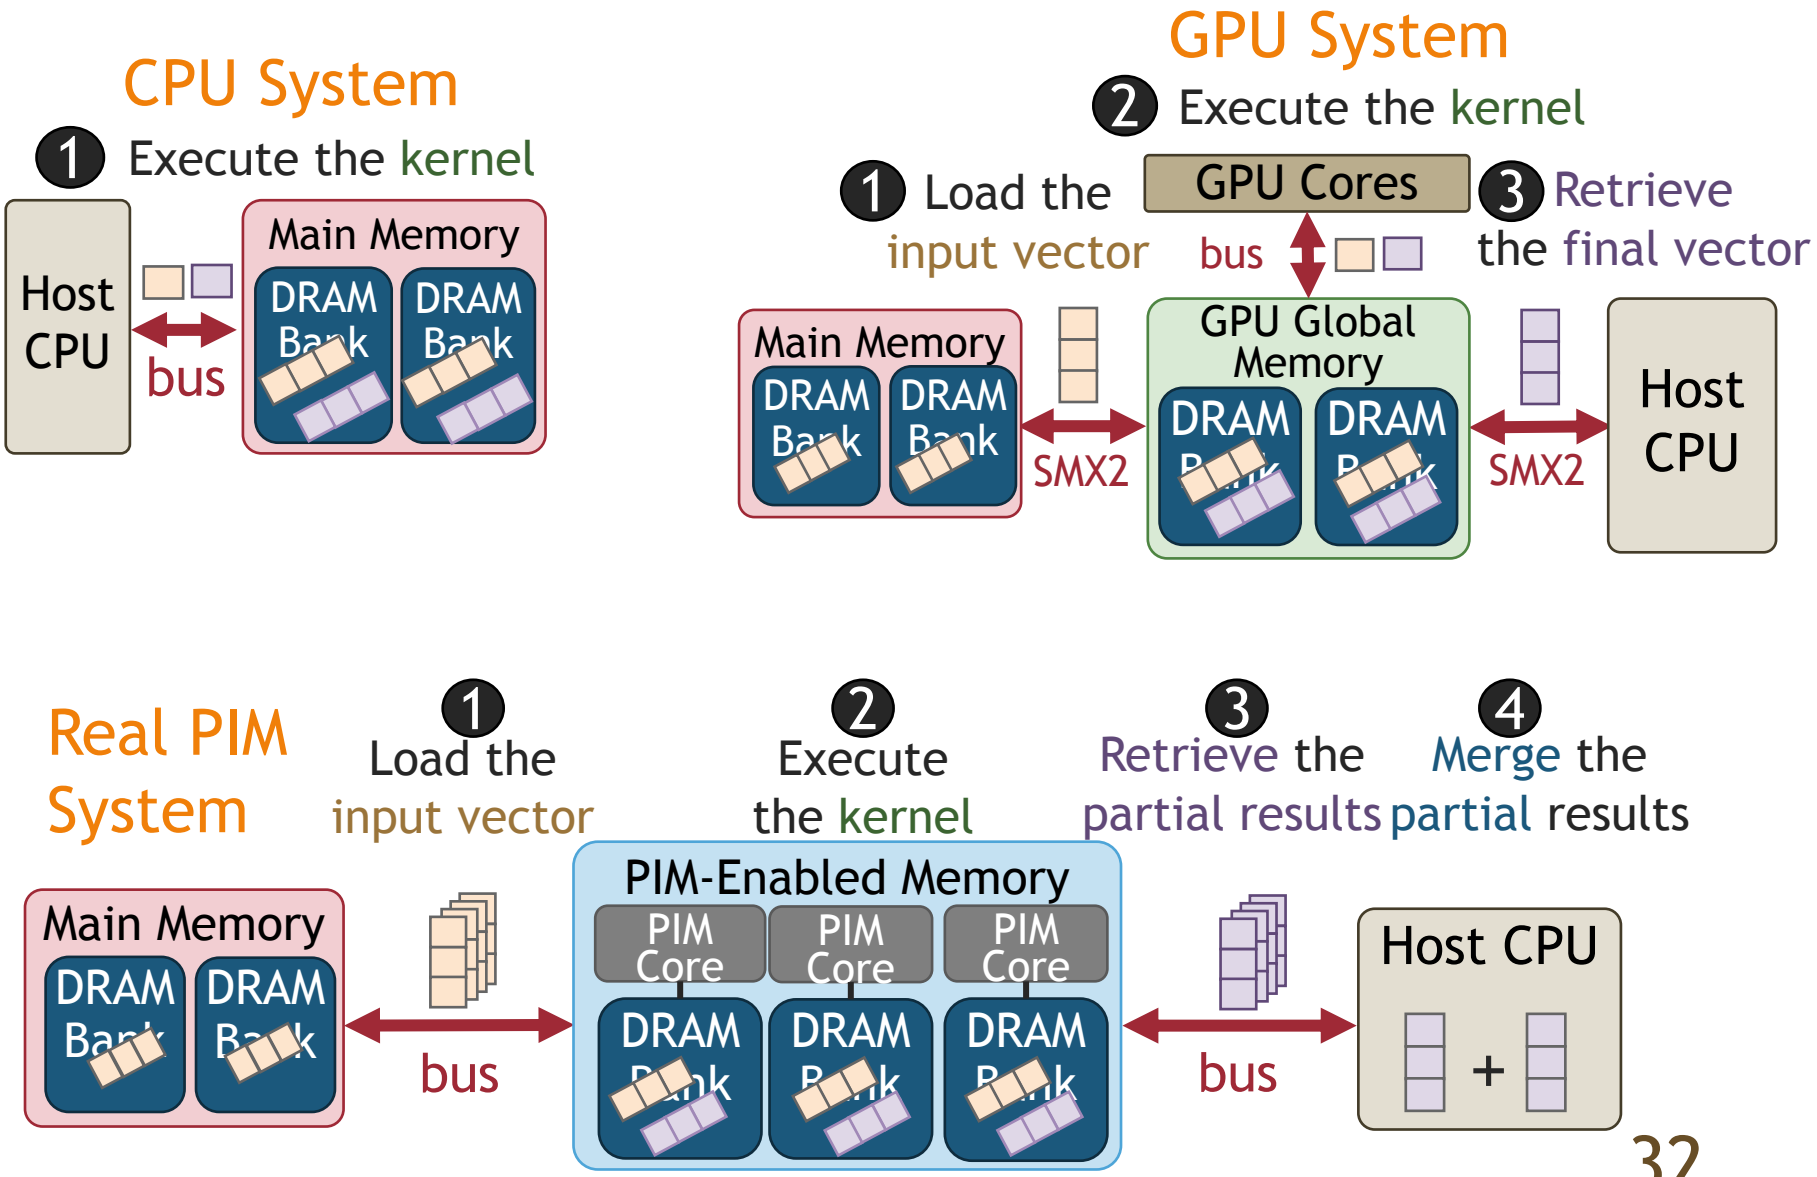
Expensive data transfers to/from PIM-enabled memory performed via the narrow memory bus impose significant performance overhead to end-to-end SpMV execution. Thus, it is hard to fully exploit all available PIM cores of the system.



Recommendation 4

Design high-speed communication channels and optimized libraries in data transfers to/from PIM-enabled memory, provide hardware support to effectively overlap computation with data transfers in the PIM system, and/or integrate PIM-enabled memory as the main memory of the system.

SpMV Execution on Various Systems



CPU/GPU Comparisons

System		Peak Performance	Bandwidth	TDP
CPU	Intel Xeon Silver 4110	660 GFlops	23.1 GB/s	2x85 W
GPU	NVIDIA Tesla V100	14.13 TFlops	897 GB/s	300 W
PIM	UPMEM 1st Gen.	4.66 GFlops	1.77 TB/s	379 W

Processor-Centric

Memory-Centric

CPU/GPU Comparisons

- Kernel-Only (COO, 32-bit float):
  - CPU = 0.51% of Peak Perf.
  - GPU = 0.21% of Peak Perf.
  - PIM (1D) = **50.7%** of Peak Perf.

System		Peak Performance	Bandwidth	TDP	
CPU	Intel Xeon Silver 4110	660 GFlops	23.1 GB/s	2x85 W	Processor-Centric
GPU	NVIDIA Tesla V100	14.13 TFlops	897 GB/s	300 W	
PIM	UPMEM 1st Gen.	4.66 GFlops	1.77 TB/s	379 W	Memory-Centric

CPU/GPU Comparisons

- Kernel-Only (COO, 32-bit float):
  - CPU = 0.51% of Peak Perf.
  - GPU = 0.21% of Peak Perf.
  - PIM (1D) = **50.7%** of Peak Perf.

- End-to-End (COO, 32-bit float):
  - CPU = **4.08 GFlop/s**
  - GPU = 1.92 GFlop/s
  - PIM (1D) = 0.11 GFlop/s

Outline

SpMV Kernels for Real PIM Systems

Key Takeaways from Our Study

Conclusion

Conclusion

- SpMV is a fundamental linear algebra kernel for important applications (HPC, machine learning, graph analytics…)
- SpMV is a highly memory-bound kernel in processor-centric systems (e.g., CPU and GPU systems)
- Real near-bank PIM systems can tackle the data movement bottleneck (high parallelism, large aggregate memory bandwidth)
- Key Contributions:
  - *SparseP* : first open-source SpMV library for real PIM systems
  - Comprehensive characterization and analysis of SPMV on the first real PIM system
  - Recommendations to improve multiple aspects of future PIM hardware and software
